1.0 INTRODUCTION

The King County Flood Control District (District) proposes developing a Lower Green River Corridor Flood Hazard Management Plan (Plan) to guide future flood hazard management investments. This is critically important to protect people, property, and communities from the adverse and often devastating impacts of floods. The goal of the Plan is to provide a long-term approach to reduce flood risks, to address Tribal interests, and to improve fish habitat, while supporting the economic prosperity of the region.

The District, which is the lead agency for this proposal, determined that the Plan is likely to have significant adverse impacts on the environment and prepared a non-project, or programmatic, environmental impact statement (PEIS), as required by the Washington State Environmental Policy Act (SEPA), in accordance with the Revised Code of Washington (RCW) 43.21C.030 (2)(c). The PEIS serves as a comprehensive tool to assess the environmental implications of the Plan and proposed alternatives. Its purpose is to inform decision-makers and the public, facilitate sustainable planning, and guide the implementation of actions that minimize negative environmental impacts while maximizing positive outcomes.

The draft PEIS describes the affected environment within the Lower Green River Corridor, defines three alternative approaches to managing flood risk, and identifies potential impacts to the built and natural environment for each of these alternative approaches. The draft PEIS was issued on March 20, 2023, marking the beginning of a public comment period.

The public comment period is an essential component of the SEPA process and is designed to ensure transparency, public participation, and the consideration of diverse perspectives. Comments can address any aspect of the document, such as the accuracy of the analysis, the adequacy of mitigation measures, the proposed alternatives, or any other issue relevant to the proposed Plan.

The public comment period for the draft PEIS began on March 20, 2023, and concluded on June 20, 2023. The public comment period provided Tribes, agencies, businesses, intergovernmental entities, nongovernmental organizations (NGOs), and members of the public an opportunity to comment on the alternatives, areas of study, probable significant adverse impacts, and mitigation. During the public comment period, participants were able to provide comments in the following ways: online form, email, written correspondence, verbal comment at public meetings, or community discussion form provided at tabling events.

Over 800 comments were provided using the community discussion form. The District developed this form in collaboration with community navigators. Navigators have cultural and linguistic knowledge and lived experience to help bridge gaps between the many diverse communities in the project area. They advised the District on culturally appropriate ways to educate/engage their communities and the best materials to utilize, including the short form with questions to stimulate discussion. The community discussion form included the following four questions:

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding?
2. How are these assets used by community members?
3. What are [the multibenefits] most important to you and why?
4. Anything else you'd like to comment on regarding flooding in your community?

Section 2.0 of this appendix summarizes and tabulates comments received during the comment period. Section 3.0 of this appendix provides individual responses to all of the comments received during the comment period. Additional information on the public comment process and comment cataloging can be found in the Comment Summary Report.

2.0 SUMMARY OF COMMENTS RECEIVED

The District received a total of 904 comment items during the comment period. The items were comprised of 13 emails, 16 online comment forms, 872 community discussion forms, and 3 verbal comments.

Of these 904 items, 14 items were received from Tribes, jurisdictions, agencies, intergovernmental entities, businesses, and non-governmental organizations (NGOs), and 890 items were received from individual members of the public. The 14 items are listed below with coding assigned based on source and order received:

- Tribes: 2
  T-1: Snoqualmie Tribe
  T-2: Muckleshoot Indian Tribe
- Agencies: 1
  A-1: WA Ecology/WA Department of Fish & Wildlife
- Businesses: 2
  B-1: Tenerelli Properties
  B-2: Starfire Sports
- Intergovernmental Entities: 1
  IG-1: WRIA 9 Watershed Ecosystem Forum
- Jurisdictions: 6
  J-1: City of Kent
  J-2: City of Tukwila
  J-3: King County
  J-4: City of Kent (staff verbal comment)
  J-5: City of Tukwila (staff verbal comment)
  J-6: City of Seattle
- NGOs: 2
  O-1: American Rivers/Conservation Northwest/Future Wise/Green River Coalition/Orca Network/Puget Soundkeeper/The Center for Environmental Law & Policy/The Nature Conservancy/Urban Waters
  O-2: Master Builders Association of King and Snohomish Counties

Of the 890 individual comment items, 872 were community discussion forms used by the Community Navigators. These comments are coded N-1 through N-872. Of the 872 discussion forms received, 1 was in Arabic, 111 were in Chinese, 32 were in Somali, 51 were in Spanish, 112 were in Vietnamese, and 565 were in English.

The District categorized the comments using topics in the draft PEIS. Comments from the community discussion forms were tabulated separately. The results are summarized below, and the detailed catalog can be found in the Comment Summary Report.

Comments Received by Letter, Email, Comment Form, or Verbal Comment

The District received 32 comment items that were not submitted via community discussion forms, and these submissions were comprised of 228 individual comments. For each of the individual comments, one overall topic was assigned but multiple subtopics were assigned, if needed. For example, the topic assigned to a comment about housing and businesses is Built Environment, and two subtopics are identified (Housing; Employment and Business).

- 60 of the comments were assigned to the Alternatives Development topic. Most comments in this category addressed components common to all project alternatives, and of the comments that mentioned specific alternatives, most referenced Alternative 3 (17).
- 49 of the comments were assigned to the Built Environment topic. Most comments in this category addressed public services (21), land use (11), housing (11), and infrastructure (5).
- 41 of the comments were assigned to the Natural Environment topic. Most comments in this category addressed aquatic resources (16), hydraulics and hydrology (15), water quality (7), and climate change (5).
- 22 of the comments were assigned to the Next Steps topic, including plan development and implementation, funding, maintenance, specific projects, and future partnerships.
- 20 of the comments were assigned to the Multibenefits topic, including references to the District's multibenefit motion (FCD Motion 20-07) and integrated floodplain management. Of the 10 multibenefits, recreation was mentioned most frequently.
- Other comment categories include Equity and Social Justice (6), Cumulative Impacts (12), Tribal Matters (4), Outreach and Engagement (5), and Other (9).

Comments Received by Community Discussion Form

The 872 community discussion forms received by the District each included up to 3 individual comments for a total of 2,250 individual comments.

In responding to the questions regarding the types of community assets that people use or rely on that might be impacted or damaged by flooding (Questions #1 and #2), people could choose multiple assets. The majority of the comments (94%) expressed concern for elements of the built environment. Of these, the elements of greatest concern were:

- Public services (472 comments), including schools, parks, and other recreational facilities
- Social resources (344 comments), including places of worship and community gathering spaces
- Infrastructure (319 comments), including transportation and the ability to get to work, school, and other places
- Housing (319 comments)

In identifying the multibenefits that are most important (Question #3), many members of the community referred back to elements of the environment, rather than specific multibenefits:

- 428 discussion forms referred back to elements of the built environment.
- 170 discussion forms referred back to elements of the natural environment.
- 155 discussion forms expressed support for all of the multibenefits or for elements of both the built and natural environments.

When asked to provide any other information about flooding in the community (Question #4), most comments referred back to previous answers, including elements of the built environment, natural environment, or multibenefits, or expressed opinions about project alternatives.

3.0 DETAILED RESPONSES TO COMMENTS

T-1: Snoqualmie Tribe

Comment T-1-1

Dear Ms. Clark, Please accept the following comments regarding the King County Flood Control District (District) Lower Green River Corridor Flood Hazard Management Plan Draft Programmatic Environmental Impact Statement (PEIS). These comments are follow-up comments to those submitted by the Tribe to the District in January 2019 and March 2022, which were in regards to the prior version of the PEIS and this version's scope. The Snoqualmie Tribe—sduk?albix? in our Native language—consists of a group of Coast Salish Native American peoples from the Puget Sound region of Washington State. We have been in the Puget Sound region and the Snoqualmie Valley since time immemorial. sq?ed (Snoqualmie Falls) is the birthplace of the sduk?albix?. We had more than 90 long houses along the Snoqualmie River and its tributaries. These rivers and streams were the highways used to travel from village to village and connected all the ?aciltalbix? (Natives). Our Tribe was a signatory of the Treaty of Point Elliott with the United States and Territory of Washington in 1855. At that time, our people composed one of the largest tribes in the Puget Sound region totaling around 4,000. We lost federal recognition in 1953, but after much battle, we regained federal recognition in October of 1999. Today, the Snoqualmie Tribe is made up of approximately 650 members and occupies a sovereign homeland in the Snoqualmie Valley. The Snoqualmie Tribe (Tribe) is governed by an elected Council and our Tribal Constitution.

Response to T-1-1

Thank you for providing comments on the draft PEIS.

Comment T-1-2

The Tribe is encouraged by the addition of restorative actions to the Lower Green River Corridor Flood Hazard Management Plan Draft PEIS Alternatives that are now being considered in the planning process. In particular, Alternative 3, Enhanced Systematic Multi-Benefit Implementation, is reflective of the Tribe's prior comments and the Tribe's recommendations on the correct approach to take to improving river ecosystem and Puget Sound health, by taking considered, restorative actions within King County. We appreciate the revised focus that applies a Multi-Benefit lens to all the alternatives being considered.

Response to T-1-2

Thank you for your comments regarding the approach taken with Alternative 3. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take further input from the Snoqualmie Tribe and interested parties.

Comment T-1-3

We further appreciate that the District appears to have been responsive the Tribe's and others' requests for revision of the action alternatives to be consistent with existing District policies in the 2006 and 2013 King County Flood Hazard Management Plan, and we urge a continued focus on these policies, including:

- Policy G-3 - Comprehensive River & Flood Hazard Management: King County should provide comprehensive river and flood hazard management through the implementation of projects and programs that result in multiple benefits, including those created by meeting any or all of the following non-prioritized objectives, including (e) protect and, where possible, enhance aquatic and riparian habitat in a manner consistent with adopted salmon habitat recovery plans.

- Policy G-4 – River and Flood Hazard Management Services: King County should provide river and flood hazard management services to reduce the risk of flood and channel migration hazards by preserving open space in flood hazard areas and channel migration zones.
- Policy G-10 - Protecting Natural Functions & Values: King County shall protect flood storage, conveyance, and ecological values of floodplains, wetlands, and riparian corridors and, when feasible, should enhance or restore these ecological functions and values. Flood risk reduction strategies and projects should be coordinated on a river-reach scale with the salmon habitat recovery plans.
- Policy G-6 – Inter-Government Coordination and Cooperation: King County flood hazard management activities should be planned and implemented in close cooperation with cities, counties, tribes, salmon habitat recovery planning partners and other agencies sharing jurisdiction in each basin.
- Policy PROJ-6 - Flood Protection Facility Design & Maintenance Objectives: King County should construct new flood protection facilities and maintain, repair or replace existing flood protection facilities in such a way as to: (a) require minimal maintenance over the long term; (b) ensure that flood or channel migration risks are not transferred to other sites; (c) protect or enhance aquatic, riparian and other critical habitats; and (d) protect or enhance multiple beneficial uses of flood hazard areas.
- Policy PROJ-7 - Flood Protection Facilities within Critical Areas Ordinance Aquatic Areas and Aquatic Area Buffers: Wherever possible, King County should relocate existing flood protection facilities farther from the river edge and associated buffers to increase flood conveyance and allow natural river processes to occur.

Response to T-1-3

Thank you for your comment. As noted in PEIS Appendix A Section 2.1, the 2006 King County Flood Hazard Management Plan (the county-wide plan) serves as the Comprehensive Plan of Development for the King County Flood Control District. The Lower Green River Corridor Flood Hazard Management Plan would be an area-specific plan that would follow the policies included in the 2006 King County Flood Hazard Management Plan.

Comment T-1-4

It appears that at least Alternatives 2 and 3, but in particular Alternative 3, would enable an assessment of the costs and benefits associated with more property acquisitions, including levee setback and levee removal projects. These types of multi-objective projects address the most critical habitat needs in many of our Salish Sea rivers, including the Lower Green and the Snoqualmie River, but they also serve the District's and the ratepayers' needs by being fiscally responsible over the long term, because a one-time investment relieves the District of untold future liability in maintaining facilities in the face of a changing climate. Ambitious multi-objective projects that reconnect the floodplain and enhance habitat while at the same time reduce flood risk are the path to creating a resilient river corridor, which should be the overall goal of the Plan.

Response to T-1-4

Thank you for your comment.

Comment T-1-5

In our last letter, we requested that the following specifics be addressed in the PEIS:

Alternative 1 – Project by Project Multi-Benefit Implementation

What are the implications of maintaining existing facilities on aquatic habitat, including ongoing impacts to ESA-listed species through lack of edge complexity or access to off-channel habitat, lack of flood refuge, lack of flood storage, lack of vegetation and how this affects water temperature and other water quality parameters? What additional risks are posed by not systematically and consistently pursuing adaptive management throughout the corridor?

Response to T-1-5

Alternative 1 (PEIS section 3.3) would implement projects on a case-by-case basis and continue vegetation management consistent with the terms of the 2019 System-wide Improvement Framework (SWIF). As noted in PEIS Appendix B Section 5.1.2, Alternative 1 would result in the greatest extent of riverbank retained in or converted to Type A facilities and the least extent of riverbank retained in unarmored condition. Fewer river miles of existing PL 84-99 facilities would be set back (i.e., converted from Type A to another facility type) and vegetation would be managed consistent with the 2019 SWIF. PEIS Appendix B Attachment 1 analyzes and compares the facility types.

Under Alternative 1, future flood control facilities would be implemented on a project-by-project basis. This approach may provide fewer opportunities than Alternatives 2 and 3 for strategic coordination between, and adaptive management of, flood control and restoration planning. This could in turn result in lost opportunities and reduced effectiveness of some future restoration actions. Project-specific implementation and maintenance would be done in accordance with the regulatory framework described in PEIS Appendix A Section 2.2, and applicable mitigation requirements would be implemented to avoid, minimize, restore, and/or compensate for impacts to regulated natural resources.

Comment T-1-6

Alternative 2 – Systematic Multi-Benefit Implementation

What ongoing deficits to ecosystem recovery, inherent tribal rights, and river corridor flood resilience will be sustained by not pursuing the additional measures called for in Alternative 3?

Alternative 3 – Enhanced Systematic Multi-Benefit Implementation

Does this alternative represent enough opportunity to reverse the current trajectory of diminishing resources and diminishing ability and opportunity for tribes to access the resources to which they retain inherent rights? While the Draft PEIS does compare and contrast the three Alternatives, and the No Build Scenario, it does not explicitly answer the questions above; rather, it leaves those conclusions open for the reader to analyze. We suggest that Alternative 1 should more definitively address the environmental conditions discussed above. And, while the tables in the PEIS do compare impacts to cultural and historic resources, analyses to impacts to inherent tribal rights are not specifically analyzed. In the Final PEIS, the District should strive to identify and select a preferred Alternative that maximizes tribal members' ability to exercise their inherent rights.

Response to T-1-6

PEIS Section 3.3 discusses the similarities between Alternatives 2 and 3 in terms of emphasis on systematic planning and adaptive management of future flood control projects. This could provide greater opportunity to coordinate flood control actions with habitat restoration to optimize ecological benefits. Alternatives 2 and 3 differ from one another in terms of the amount of habitat associated with flood control facilities that would be made available for restoration: 185-285 acres under Alternative 3 versus 100-150 acres under Alternative 2. In addition, Alternative 3 includes targeted purchases of floodplain properties for dedicated flood storage, of which 195-295 acres would be available for habitat restoration (see PEIS Appendix B, Table 5-9). Given that the location and design of potential facilities is not currently known, it is not possible to predict with certainty how each alternative will affect the future condition of aquatic resources. However, the PEIS does provide a qualitative comparison of the alternatives in terms of their ability to meet Necessary Future Conditions (NFC) for the ecological functions considered in the PEIS, as defined in the WRIA 9 2021 Salmon Recovery Plan. This analysis is provided in PEIS Appendix B, with a detailed tabular summary provided in Attachment C to Appendix B. Alternative 3 is most likely to support attainment of NFC across all ecological functions and would make the largest amount of channel margin, riparian, and floodplain habitat available for restoration.

Tribal rights and potential impacts to cultural resources are described in PEIS Appendix E, sections 5.2 and 5.3 respectively.

Comment T-1-7

We appreciate the District's revisions to the scoping documents and the Draft PEIS to incorporate a multi-objective, multi-benefit approach into Corridor Plan development. The importance of the Lower Green and the Snoqualmie/Snohomish Rivers to salmon recovery is widely documented in ESA Critical Habitat designations for Puget Sound Chinook and steelhead, in the watersheds' respective Salmon Recovery Plans, and again more recently through Governor Inslee's Southern Resident Orca Task Force. Without adequate habitat, including in the Lower Green and the Snoqualmie, our salmon and orca will perish. When Snoqualmie leaders signed the Treaty of Point Elliot, they ceded lands from the Nisqually River to near the US-Canada border. Courts have reaffirmed time and again the obligation to provide adequate habitat for salmon, in fulfilment of promises made in the treaties and in support of inherent tribal rights.

Response to T-1-7

Thank you again for your comments and your ongoing engagement on this important process. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat.

T-2: Muckleshoot Indian Tribe

Comment T-2-1

Dear Ms. Clark: Our staff have reviewed the draft Programmatic Environmental Impact Statement (PEIS) for the Lower Green River Corridor Flood Hazard Management Plan (Plan). Our comments are provided in the interest of protecting and restoring the Tribe's treaty-protected fisheries resources. The Green/Duwamish River basin supports fisheries resources that have cultural and economic importance to the Muckleshoot Indian Tribe. Chinook, coho, chum, pink salmon, steelhead, and other fisheries resources utilize portions of the basin for spawning, rearing, holding, and migration. The Green/Duwamish River basin is part of the Tribe's Usual and Accustomed Fishing Area (U & A), as defined in U.S. v. Washington, 384 F. Supp. 312,367 (W.D. Wash. 1974). Within the U & A, the Tribe retains commercial, subsistence, and ceremonial treaty fishing rights, as well as the authority and responsibility to co-manage shared natural resources with Washington State. The Tribe invests millions each year to produce salmon and protect habitat in the Green/Duwamish River to benefit its members and Washington's citizens. Adult returns of salmon to the Green River have been substantially diminished in comparison to historical runs, and these reduced run sizes have impacted tribal treaty harvest opportunities in recent years. The Green River Chinook stock is also among the highest priority sources of prey for the endangered Southern Resident Killer Whale population (NOAA and WDFW 2018).

Response to T-2-1

Thank you for providing comments on the draft PEIS.

Comment T-2-2

The construction and maintenance of flood control facilities along the Lower Green River is problematic for treaty fishing. The existing flood control facilities are generally on over-steepened banks covered in blackberries. The extent of rock fill and size of bank protection rock has reduced scour in the river which limits eddy features that are used by adult salmon and steelhead to hold before continuing upstream migration. Historical river tribal fishing sites have been lost as a result of levee construction, maintenance, and repairs. In some areas, the levees are blocked by gates and have limited access from the landward side for tribal fishers to set their nets. All of these conditions have resulted in the loss of fishing sites and limited access for tribal fishers to those sites that remain.

Existing flood control facilities and their maintenance has degraded fish habitat. The opportunity to restore former salmon habitat in the Plan area is already diminished by existing levees and floodplain development, which have eliminated salmon productivity from thousands of acres of floodplain. Poor habitat and water quality conditions in the lower river are a grave threat to Chinook and other fish in the Green-Duwamish River, and the outlook for their long-term survival is dependent, in part, upon the approach that the King County Flood Control District (KCFCD) will take in this Lower Green River Corridor Flood Hazard Management Plan (Plan).

Response to T-2-2

PEIS Section 1.3 and Appendix B Section 5.2 describe how flood protection facilities have not always historically been designed with salmon habitat in mind. However, as described in PEIS Appendix A, current design approaches include opportunities to integrate salmon-friendly vegetation into these facilities. PEIS Appendix A provides a description of the vegetation plan included in the System-wide Improvement Framework (SWIF) that was approved by the U.S. Army Corps of Engineers in 2019. The plan shows how salmon-friendly vegetation can be included in facility design where space is available. In general, where space allows, the SWIF Vegetation Management Plan encourages establishing native vegetation on the riverward side of flood management facilities.

The three alternatives evaluated in the PEIS present different approaches for when and where new facilities could be constructed with respect to the river channel and when and where existing facilities could be improved and relocated farther from the river channel. How these different approaches could affect aquatic species and habitat is described in Chapter 4 of the PEIS and detailed in Appendix B Section 5.6.

Comment T-2-3

It is vital that the Plan seeks to achieve a dramatic improvement in habitat conditions on equal terms with its flood risk reduction objectives. The construction and maintenance of flood control facilities is a leading cause of lethal temperatures and degraded salmon habitat in the lower 28 miles of the river. This river reach suffers from deficient tree shade, few deep pools for adult salmon, and essentially no natural floodplain rearing areas for salmon. Seven-day average daily maximum temperatures in the lower Green River typically exceed 70°F and can exceed 75°F, far exceeding the Washington state water quality criteria of 60.8°F and 63.5°F that are established to protect fish life. These temperatures are high enough to promote disease outbreaks and pre-spawning mortality in migrating adult Chinook and other negative effects on other species and/or life stages. Fortunately, modeling conducted for the Green River Temperature TMDL Study (Ecology 2011) found that tall tree shade along the river would reduce temperatures to meet or nearly meet the state temperature criteria.

Response to T-2-3

The intent of all three alternatives under consideration is to prioritize multibenefit projects, including those that advance habitat protection and salmon recovery. The multibenefits are described and evaluated in Chapter 5 of the PEIS. The District's multibenefit policy does not give weight to one multibenefit over another.

Please refer to the response to T-2-2 regarding vegetation on flood facilities. The effects of the three alternatives on water quality, including temperature, are provided in PEIS Appendix B Section 4.3. This evaluation considers the potential for shading but notes location-specific constraints limit its potential on a Corridor-wide basis.

Comment T-2-4

Presently, 17 miles of levees in the lower river are enrolled in the U.S. Army Corps of Engineers' PL-84-99 program in which levee repairs are federally funded at 80 percent in exchange for compliance with very salmon-unfriendly design and vegetation maintenance rules. These rules mandate levee repairs using significant rock armoring, tree removals, and thinning that perpetuate ongoing habitat loss and degradation despite mitigation measures used. The lower Green River's entrenched and narrow confined condition within revetments and steeply-sloped levees contributes to a cycle of repairs and reconstruction resulting in chronic impacts to habitat and to tribal fishing sites.

The alternatives described in the PEIS are insufficient to correct these problems and shortcomings. The PEIS considers an important advance in integrating flood risk management that embraces "a greater emphasis on conserving and restoring habitat for threatened salmon and other species." The PEIS also includes analysis that advances informed consideration of such integrated management. We offer the following comments and recommendations on the PEIS and the Plan.

Response to T-2-4

The PEIS Chapter 3 describes the ability to incorporate habitat features and vegetation as a function of the amount of space available between the crest of the levee and the river channel. More detail is provided in PEIS Appendix A Section 4.5.3 and 4.5.4, as well as the response to comment T-2-2. Enrollment in the PL84-99 Program alone does not dictate a design unfriendly to habitat and aquatic species. All three of the alternatives consider improvements and potential relocation of existing levees and floodwalls to varying degrees. The results of these actions are communicated in PEIS Appendix B Section 5.6.

Comment T-2-5

Perspectives on the PEIS

The Plan evaluated in the PEIS lacks needed vision, commitments, and incentives for restoring habitat for threatened salmon and other species. Most significantly, the Plan considers habitat recovery as secondary to flood hazard management, rather than a commensurate concern. Moreover, the Plan merely intends support of habitat restoration as equated with other issues that are not river dependent such as trails, recreation, and economic development. The Plan warrants improvement to expand its scope of habitat recovery by incentivizing collaboration, as necessary to meet approved 10- to 15-year targets for habitat and capital projects described in the WRIA 9 2021 Salmon Habitat Plan Update. An approach that merely offers greater emphasis on habitat recovery is incomplete and inadequate. Similarly, an approach that likely, partially, or potentially achieves a meaningful contribution toward salmon habitat restoration targets described in the WRIA 9 2021 Salmon Habitat Plan Update seems unlikely to meet those targets during their approved 10- to 15- year timeframe, and lacks clarity about broader work for habitat recovery during the Plan's fuller 30- to 50-year implementation period. Plan alternatives logically rely on collaboration with Tribes, local jurisdictions, and stakeholders. But the Plan lacks incentives for collaboration on habitat restoration, in contrast to benefits for flood hazard management that seem certain within the Plan's implementation period. The Plan's lacks of incentives for collaboration on habitat restoration invites a perpetuation of outcomes like those for Lower Russell Levee Setback project, where roads and trails were retained or added in the Green River's shoreline management zone despite viable alternatives.

Response to T-2-5

The intent of all three alternatives under consideration is to prioritize multibenefit projects, including those that advance habitat protection and salmon recovery. The multibenefits are described and evaluated in Chapter 5 of the PEIS. The District's multibenefit policy does not give weight to one multibenefit over another. As WRIA 9 updates its recovery goals and develops longer-term goals, the District could consider whether its own goals should be updated under adaptive management. Both Alternatives 2 and 3 specifically include collaboration with Tribes, local governments, and other interested parties as part of Plan development and periodic adaptive management reviews.

Comment T-2-6

The Plan suggests there are opportunities to mitigate Plan impacts in the Lower Green River by restoring aquatic habitats and riparian zones in the Middle or Upper Green River. It is not possible to mitigate current and future impacts of lower river flood protection facilities on Green River fish populations, treaty resources and fishing sites by mitigation elsewhere in the watershed. For example, modeling found that fully shading the river up to the TPU diversion everywhere but along the levees in the lower river would still not approach meeting Washington state water temperature standards (Ecology 2011).

Response to T-2-6

The PEIS suggests mitigation in the middle and upper Green River on page 4-40. However, this approach is part of a longer list of mitigation opportunities that focus on mitigation within the Lower Green River Corridor. In summary, mitigation in the middle and upper Green River would be in addition to, rather than in lieu of, mitigation in the Lower Green River Corridor. Specific mitigation would be determined during project-specific design and permitting.

Comment T-2-7

Extent of proposed habitat restoration in the Plan appears largely status quo

Plan Alternative-3 proposes the largest area for floodplain and/or riparian habitat restoration. But the proposed rates of restoration under Alternative-3 appear comparable to recent actual rates, and thus perpetuate recent standards for habitat recovery at Lower Green River rather than improve rates for habitat recovery. Thus the Plan's most ambitious proposal for habitat recovery essentially offers a status quo scenario. Up to 405 acres could be available for floodplain and/or riparian habitat restoration under Plan Alternative-3. (This restoration apparently could repurpose up to 405 acres of adjacent land uses due to new, improved, and relocated flood hazard management facilities.) Thus during 30- and 50-year periods for Plan implementation, the proposed rates of floodplain and/or riparian habitat restoration are 13 .5 and 8.1 acres/year, respectively. The Plan includes Type C-2 facilities, described as "Large setbacks that set the levee crest well away (more than 100 feet) from the Lower Green River." Under Alternative-3, Type C-2 facilities comprise 170- to 255-acres of the estimated future areal extent of flood facility types. The area of Type C-2 facilities is at least 2.5-times greater than any other facility type. During 30- and 50-year periods for Plan implementation, the proposed rates for creation of Type C-2 facilities riverward of the levee crest are 5.7 and 8.1 acres/year, respectively. These rates include portions of Type C-2 facilities created above river stage at 2-year flow events (about 9,000 cfs). Thus the rates for creation of Type C-2 facilities under Alternative-3 merely approximate the rate at which King County and others created inundation below 9,000 cfs via comparable large-scale projects such as levee setbacks and a backwater embayment built between 2013 to 2023. Our analysis of six projects built in the Plan area between 2013 and 2023 (i.e., Reddington, Leber Phases 1&2, Downey, Riverview, South Tukwila, and Lower Russell Road) estimates these projects created a total inundation area of 66.5 acres at 9,000 cfs (chiefly intended as rearing habitat for salmon salmon). During a 10-year period, those recent projects created juvenile salmon habitat at a rate of about 6.7 acres/year, as measured at 9,000 cfs (i.e., river stage at 2-year flow events). This rate approximates the Plan's rate for comparable projects (i.e., Type C-2 facilities). They will enable inundation riverward of new levee setbacks at 5.7 to 8.1 acres/year, including at least 90% inundation above river stage at 2-year flow events (about 9,000 cfs). Thus Plan goals to provide an integrated and reasonable long-term approach to reduce flood risks, while balancing multiple objectives including habitat recovery, are best served by an approach that increases rates of habitat recovery rather than perpetuating status quo. This requires the addition and adoption of a Plan alternative that maximizes protection and recovery of aquatic species habitat in the Plan area during its 30- to 50-year implementation period.

Response to T-2-7

The impacts (and benefits) of each alternative are based on projections of how the policy-level approach of each alternative might translate into on-the-ground projects. These are described in PEIS Section 4.2. As described in PEIS Appendix B Section 5.1 (methodology), the results can be used to evaluate relative progress towards ecological restoration objectives for the Lower Green River. Because project-specific designs have not been developed, a full quantitative analysis of alternative impacts is not possible. Instead, the PEIS provides a categorical comparison of potential ecological impacts based on the linear extent of riverbank and area of floodplain habitat available for restoration under each alternative. It should also be noted that the projections used to calculate impacts (and benefits) are based on existing conditions and land uses. Under Alternative 3 there are opportunities to maximize levee setbacks beyond the projections in the PEIS through collaboration with the local jurisdiction with land use authority. Regarding an additional alternative that maximizes the protection and recovery of aquatic species, the District's multibenefit policy does not prioritize one multibenefit over another. The multibenefits are described and evaluated in Chapter 5 of the PEIS. The District can and does collaborate on the approach to habitat protection and recovery with Tribes, federal and state agencies, and local jurisdictions.

Comment T-2-8

Recommendations

We recommend the following actions to create a viable Plan. Please refer to our 2019 OS/Scoping Notice comments for additional recommendations (attached). 1. Add and adopt a Plan alternative that maximizes protection and recovery of aquatic species habitat in the Plan area during its 30- to 50-year implementation period, yielding a breadth and certainty of outcomes comparable to those for flood hazard management. 2. Add and adopt a Plan alternative that maximizes recovery of riparian habitat in the Plan area during its 30- to 50-year implementation period, yielding conditions that enable realization of targets for effective shade along the Lower Green River, as described in the Green River Temperature TMDL (WDOE 2011).

Response to T-2-8

Alternative 3 provides enhanced systematic implementation of multibenefits, and as demonstrated by the evaluation results, contributes the most to protection and recovery of aquatic species habitat and recovery of riparian habitat. As explained in PEIS Chapter 4 and detailed in Appendix B Attachment C, Alternative 3 is most likely to support attainment of the necessary future conditions defined in the WRIA 9 2021 Salmon Recovery Plan across all ecological functions and would make the largest amount of channel margin, riparian, and floodplain habitat available for restoration. The District's multibenefit policy does not prioritize one multibenefit over another; the multibenefits are described and evaluated in Chapter 5 of the PEIS. The Muckleshoot Indian Tribe’s scoping comments are responded to below.

Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the Muckleshoot Indian Tribe and interested parties.

Comment T-2-9

3. During the 10- to 15-year period after Plan adoption, collaborate as necessary and dedicate funding to meet the 10- to 15-year habitat targets for the Lower Green River described in Chapter 6 of the WRIA 9 2021 Salmon Habitat Plan Update. 4. During the 10- to 15-year period after Plan adoption, collaborate as necessary and dedicate funding to implement the capital projects for the Lower Green River described in Chapter 7 of the WRIA 9 2021 Salmon Habitat Plan Update.

Response to T-2-9

Thank you for your comment. The District is a primary funder for WRIA 9, and as such, supports salmon habitat projects done by WRIA 9 in the Lower Green River Corridor and elsewhere.

Comment T-2-10

5. Add and adopt a Plan that (1) requires compressive mapping of bathymetry in the Plan area within 2-years of Plan adoption, and (2) explains per WAC 197-11-080(2), there are gaps in relevant information or scientific uncertainty concerning significant impacts because compressive bathymetry is lacking in the Plan area.

Response to T-2-10

An element common to all three alternatives is to continuously study the effects of climate change and use best available science for flood hazard management planning, adaptive management, and facility design. However, comprehensive bathymetry is not necessary for a programmatic level of review. The modeling used for the draft PEIS is intended to allow a programmatic comparison of the three alternative approaches for flood hazard management. As described in PEIS Section 3.3, the elements common to all alternatives include the application of best available science for flood hazard management planning, adaptive management, and facility design.

Muckleshoot Indian Tribe Scoping Comments (attached to the draft PEIS comments)

Comment T-2-11

Our staff have reviewed the Determination of Significance (DS)/Scoping Notice for the proposed Programmatic Environmental Impact Statement (PEIS) to be developed for the Lower Green River Corridor Flood Hazard Management Plan. Our comments are provided in the interest of protecting and restoring the Tribe's treaty- protected fisheries resources. The Green/Duwamish River basin supports fisheries resources that have cultural and economic importance to the Muckleshoot Indian Tribe. Chinook, coho, chum, pink salmon, steelhead, and other fisheries resources utilize portions of the basin for spawning, rearing, holding, and migration. The Green/Duwamish River basin is part of the Tribe's Usual and Accustomed Fishing Area (U & A), as defined in U.S. v. Washington, 384 F. Supp. 312,367 (W.D. Wash. 1974). Within the U & A, the Tribe retains commercial, subsistence, and ceremonial treaty fishing rights, as well as the authority and responsibility to co-manage shared natural resources with Washington State. The Tribe invests millions each year to produce salmon and protect habitat in the Green/Duwamish River to benefit its members and Washington's citizens. Adult returns of salmon to the Green River have been substantially diminished in comparison to historical runs, and these reduced run sizes have impacted tribal treaty harvest opportunities in recent years. The Green River Chinook stock is also among the highest priority sources of prey for the endangered Southern Resident Killer Whale population (NOAA and WDFW 2018).

Response to T-2-11

Thank you for submitting scoping comments in 2019. After reviewing them, the District developed PEIS Appendix E, which summarizes evaluations pursuant to Tribal matters.

Comment T-2-12

The construction and maintenance of flood control facilities along the Lower Green River is problematic for treaty fishing. The existing flood control facilities are generally on over-steepened banks covered in blackberries. The extent of rock fill and size of bank protection rock has reduced scour in the river which limits eddy features that are used by adult salmon and steelhead to hold before continuing upstream migration. Historical river tribal fishing sites have been lost as a result of levee construction, maintenance, and repairs. In some areas, the levees are blocked by gates and have limited access from the landward side for tribal fishers to set their nets. All of these conditions have resulted in the loss of fishing sites and limited access for tribal fishers to those sites that remain.

Response to T-2-12

PEIS Section 1.3 and Appendix B Section 5.2 describe how flood protection facilities have not always historically been designed with salmon habitat in mind. However, as described in PEIS Appendix A, current design approaches include opportunities to integrate salmon-friendly vegetation into these facilities. PEIS Appendix A provides a description of the vegetation plan included in the System-wide Improvement Framework (SWIF) that was approved by the U.S. Army Corps of Engineers in 2019. The plan shows how salmon-friendly vegetation can be included in facility design where space is available. In general, where space allows, the SWIF Vegetation Management Plan encourages establishing native vegetation on the riverward side of flood management facilities.

The three alternatives evaluated in the PEIS present different approaches for when and where new facilities could be constructed with respect to the river channel and when and where existing facilities could be improved and relocated farther from the river channel. How these different approaches could affect aquatic species and habitat is described in Chapter 4 of the PEIS and detailed in Appendix B Section 5.6.

Comment T-2-13

Existing flood control facilities and their maintenance has degraded fish habitat. The opportunity to restore former salmon habitat in the Plan area is already diminished by existing levees and floodplain development, which have eliminated salmon productivity from thousands of acres of floodplain. Poor habitat and water quality conditions in the lower river are a grave threat to Chinook and other fish in the Green-Duwamish River, and the outlook for their long-term survival is dependent, in part, upon the approach that the King County Flood Control District (KCFCD) will take in this Lower Green River Corridor Flood Hazard Management Plan (Corridor Plan).

Response to T-2-13

As requested in your scoping comment, the PEIS addresses these topic areas. PEIS Appendix B Section 5.2 describes historical changes to aquatic habitat in the Lower Green River. The effects of the three alternatives on water quality, including temperature, are provided in PEIS Appendix B Section 4.3.

Comment T-2-14

It is vital that the Corridor Plan seeks to achieve a dramatic improvement in habitat conditions on equal terms with its flood risk reduction objectives. The construction and maintenance of flood control facilities is a leading cause of lethal temperatures and degraded salmon habitat in the lower 28 miles of the river. This river reach suffers from deficient tree shade, few deep pools for adult salmon, and essentially no natural floodplain rearing areas for salmon. Seven-day moving average maximum daily temperatures in the lower Green River typically exceed 70°F and can exceed 75°F, far exceeding the Washington state water quality criteria of 60.8°F and 63.5°F that are established to protect fish life. These temperatures are high enough to promote disease outbreaks and prespawning mortality in migrating adult Chinook and other negative effects on other species and/or life stages. Fortunately, modeling conducted for the Green River Temperature TMDL Study (Ecology 2011) found that tall tree shade along the river would reduce temperatures to meet or nearly meet the state temperature criteria.

Response to T-2-14

As requested in your scoping comment, PEIS Appendix B Section 4.3 evaluates the potential effects of the three alternatives on water quality, including temperature. This evaluation considers the potential for shading but notes that location-specific constraints limit its potential on a corridor-wide basis.

Comment T-2-15

Presently, 17 miles of levees in the lower river are enrolled in the U.S. Army Corps of Engineers' PL-84-99 program in which levee repairs are federally funded at 80 percent in exchange for compliance with very salmon-unfriendly design and vegetation maintenance rules. These rules mandate levee repairs using significant rock armoring, tree removals, and thinning that perpetuate ongoing habitat loss and degradation despite mitigation measures used. The lower Green River's entrenched and narrow confined condition within revetments and steeply-sloped levees contributes to a cycle of repairs and re-construction resulting in chronic impacts to habitat and to tribal fishing sites.

Response to T-2-15

Please refer to the response to comment T-2-4.

Comment T-2-16

The alternatives described in the DS are insufficient to correct these problems and shortcomings. Instead, they would largely maintain the status quo for existing levees and construct up to 30 miles of new or improved levees, most of which still would require the same level of salmon-unfriendly PL-84-99 vegetation maintenance and repairs over time. The alternatives also fail to capitalize upon opportunities to maximize restoration of fish habitat within the Plan area or reflect the need for that effort. For example, all Plan alternatives should be expanded to include all restoration sites mapped from Alternative -3 of the interim Green River System-Wide Improvement Framework (SWIF), such as extensive setback levees on left bank Green River at (a) Teufel Nursery site above 228th Bridge, (b) Cow Lake below 228th Bridge, and (c) Valley Floor Community Park below 212th Bridge.

Response to T-2-16

Following the 2018-2019 scoping period, based in part on scoping comments received, the District decided to develop three new alternatives that better address the District's commitment to integrated floodplain management and the achievement of multibenefits. The new alternatives were evaluated in the draft PEIS. The multibenefits are described and evaluated in Chapter 5 of the PEIS.

Comment T-2-17

The FCD policy guidance (FCD Motion No. 18-01.2) for the Corridor Plan restricts land acquisition for levee setbacks wide enough for adequate riparian vegetation and off-channel Chinook rearing habitat to places that would not impact existing agricultural land, buildings, parking, or traveled roadways. Therefore, all or nearly all of the lower river would be off limits for significant improvement for salmon habitat and riparian conditions. This policy, combined with the FCD's reliance on the PL-84-99 program, almost guarantees the perpetuation of poor habitat and lethal water temperatures in the lower Green River.

Response to T-2-17

Following the 2018-2019 scoping period, based in part on scoping comments received, the District developed three new alternatives. The new alternatives offer greater flexibility in acquisition and acquisition-related impacts, as described in PEIS Section 3.3 and Appendix A Section 4.2.3.

Comment T-2-18

Finally, it is important to understand that it is not possible to mitigate the current and future impacts of lower river flood protection facilities on Green River fish populations, and treaty resources and fishing sites by mitigation elsewhere in the watershed. For example, modeling found that fully shading the river up to the TPU diversion (river mile 60) everywhere but along the levees in the lower river would still not approach meeting the state water temperature criteria (Ecology 2011).

Response to T-2-18

Please refer to the response to comment T-2-4.

Comment T-2-19

Our specific comments and recommendations to the OS/Scoping Notice for Draft PEIS for the Lower Green River Flood Hazard Management Plan (Corridor Plan) are below: The Draft PEIS should address the following significant adverse impacts for each of the alternatives considered in the OS/Scoping Notice: 1. Potential impacts of levee construction and repairs on pools and eddies that provide adult holding habitat for salmon and steelhead, including an inventory of all river pools and eddies, and their hydraulic characteristics at a range of stream flows.

Response to T-2-19

As requested in your 2018-2019 scoping comment, the PEIS evaluates these potential impacts to salmon habitat at a programmatic level. Please see PEIS Appendix B Section 5.

Comment T-2-20

2. Potential impacts of levee construction and repairs upon tribal fishing sites and access to these sites under each alternative. The river pools and eddies inventory from item 1 should be used cooperatively with the Tribe for a fishing site impact analysis. The analysis of the impacts should include both short- and long-term effects on hydraulic characteristics of the fishing sites and on fishing site access from upland areas, including during construction activities.

Response to T-2-20

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to fishing sites and access at a programmatic level. Please see PEIS Appendix E Table 5-1.

Comment T-2-21

3. The potential for riparian shade of adequate buffer width, tree height, and density recommended in the Green River Temperature Total Maximum Daily Load {TMDL) (Ecology, 2011) to meet the State's temperature water quality criteria given the constrained footprint and steep riverward slopes of flood facility projects (e.g., Type A and Type B) proposed in the Scoping Notice.

Response to T-2-21

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to water quality, including temperature, at a programmatic level. Please refer to PEIS Appendix B Section 4.

Comment T-2-22

4. The potential for riparian shade of adequate buffer width, tree height, and density recommended in the Green River Temperature TMDL (Ecology, 2011) to meet the State's water quality criteria for temperature given the ongoing maintenance under the interim SWIF Vegetation Management Plan.

Response to T-2-22

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to water quality, including temperature, at a programmatic level. Please refer to PEIS Appendix B Section 4.

Comment T-2-23

5. Analysis of the potential for each alternative for riparian development and necessary river shading along each of the critical, high, and medium priority river banks identified in the Lower Green River Riparian Aspect Priorities maps (Muckleshoot Indian Tribe 2013).

Response to T-2-23

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to water quality, including temperature, at a programmatic level. Please refer to PEIS Appendix B Section 4.

Comment T-2-24

6. Potential impacts for each alternative on water temperature effects on salmon and steelhead life stages as identified by EPA Issue Paper 5 (2001), including a detailed summary of the effects of water temperature impairment on juvenile and adult salmon and steelhead life stage development, growth, health, and survival and an analysis of population-level impacts for Green River Chinook, steelhead, and coho populations (hatchery and natural origin). See also: https://www.epa.gov/wa/northwest-water-quality-temperature-guidance-salmonsteelhead- and-bull-trout) https://www .govlink.org/watersheds/9/pdf/technical-whitepapers/ Green River Temperature %20and %20Salmon Technical Briefing 2 28 17 final.pdf)

Response to T-2-24

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to water quality, including temperature, and riparian habitat at a programmatic level. Please see PEIS Appendix B Sections 4 and 5.

Comment T-2-25

7. Potential impacts to the creation and maintenance of high quality juvenile Chinook rearing habitat (e.g., shallow water areas available from January through May/June with instream cover, sandy substrates, and overhanging vegetation). The DPEIS analysis should include acreage of rearing habitat expected under all alternatives and provide a comparison to applicable targets in the WRIA 9 Salmon Recovery Plan-Making Our Watershed Fit for a King (WRIA 9 Steering Committee 2005). As part of this analysis, the Draft PDEIS needs to inventory existing culverts and culverts with flapgates on tributaries at their confluences with the Green River to determine if these facilities are barriers for adult and juvenile salmon to access stream habitat upstream.

Response to T-2-25

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to riparian habitat for salmonids at various life stages, along with other aquatic species. Culverts, flap gates, and other impediments would be considered as applicable during project-level design and permitting. See Appendix B Section 5.

Comment T-2-26

8. Analysis of the cumulative effects of each alternative in combination with other reasonably foreseeable past, present, and future actions and conditions on lower river habitat and water temperatures (to river mile 11) of each alternative. This analysis should include but not be limited to a) climate change effects on temperatures in the lower river, including the potential for an increased frequency of minimum and critical instream flows that also influence stream temperatures; and b) contribution of future levee construction, repairs, and vegetation maintenance to the projected increased river temperatures associated with climate change. See https://www.govlink.org/watersheds/9/pdf/technical-whi tepapers/ WRIA9SalmonPlan-ClimateChangeBriefing FINAL 9-20-2017.pdf)

Response to T-2-26

As requested in your 2018-2019 scoping comment, cumulative impacts, including riparian habitat and water quality, are evaluated in PEIS Appendix F.

Comment T-2-27

9. An analysis of the direct and cumulative adverse effects of construction of 19 to 30 miles of new or improved levee facilities under all alternatives on physical and biological habitat processes important for salmonids, including effects on designated critical habitat for ESA listed salmonids.

Response to T-2-27

As requested in your 2018-2019 scoping comment, cumulative impacts, including riparian habitat and water quality, are evaluated in PEIS Appendix F. ESA review, including evaluation of effects on designated critical habitat, would occur as applicable during project-level environmental analysis.

Comment T-2-28

10. An analysis of the direct and cumulative adverse effects of levee maintenance and repairs of existing, new or improved levees on physical and biological habitat processes important for salmonids, including effects on designated critical habitat and PCEs for ESA listed salmonids, and riparian habitat for all alternatives.

Response to T-2-28

Please refer to the response to comment T-2-27.

Comment T-2-29

11 . An analysis of the direct and cumulative adverse effects of adding levee toe protection (more riprap at the base of the levee) for existing facilities on designated critical habitat and PCEs for ESA listed salmonids.

Response to T-2-29

As requested in your 2018-2019 scoping comment, the PEIS evaluates potential impacts to river channel banks at a programmatic level. Please see PEIS Appendix B Section 5.1.2.

Comment T-2-30

12. The potential stability of the various facility types and the need for repairs and reconstruction due to extreme flood events and climate change and the likely impacts to salmon habitat from these repairs/reconstruction.

Response to T-2-30

As requested in your 2018-2019 scoping comment the PEIS evaluation is based on facilities designed for 18,800 cfs, which is considered an extreme flood event. The impacts of repairs and maintenance are considered at a programmatic level. Please see PEIS Appendix B Section 5.

Comment T-2-31

The Draft PEIS should also include the following recommended measures to avoid, minimize, and mitigate effects of the Corridor Plan: 1. Present a new range of alternatives, each of which are capable of avoiding, minimizing, and mitigating their effects on water temperatures, salmonid habitat, salmonid populations, and tribal fishing sites in the Lower Green River while meeting flood control objectives. The range of alternatives described in the OS/scoping notice are too narrowly scoped and fail to meet state and federal requirements to avoid, minimize, and mitigate impacts.

Response to T-2-31

Following the 2018-2019 scoping period, based in part on scoping comments received, the District developed three new alternatives. The alternatives evaluated in the PEIS present a reasonable range of approaches that could manage flood risk and avoid or minimize potential impacts. Please refer to PEIS Appendix A for an explanation of how the alternatives were developed.

Comment T-2-32

2. Mitigation needs to occur where the impacts occur. It is not possible to mitigate the impacts of lower Green River flood protection facilities on Green River salmonid populations, and treaty resources and rights by providing mitigation elsewhere in the watershed. For example, the TMDL report found that shading the entire river up to Howard Hanson Dam with a tall tree buffer 150 feet wide everywhere except along the levees in the Lower Green River would still not approach meeting the State's water temperature criteria (Ecology 2011).

Response to T-2-32

The PEIS suggests mitigation in the middle and upper Green River on page 4-40. However, this approach is part of a longer list of mitigation opportunities that focus on mitigation within the Lower Green River Corridor. In summary, mitigation in the middle and upper Green River would be in addition to, rather than in lieu of, mitigation in the Lower Green River Corridor. Specific mitigation would be determined during project-specific design and permitting.

Comment T-2-33

3. KCFCD policies for the Corridor Plan should be revised to allow the acquisition of parking areas, buildings, buildings, or non-essential traveled roadways where needed and feasible to provide for setback levees of 150 feet or greater.

Response to T-2-33

Following the 2018-2019 scoping period, based in part on scoping comments received, the District developed three new alternatives. The new alternatives offer greater flexibility in acquisition and acquisition-related impacts, as described in PEIS Section 3.3 and Appendix A Section 4.2.3.

Comment T-2-34

4. Resolve the existing policy or other obstacles to the potential for acquisition of easements on agricultural land along riverbanks of critical and high value as identified in the Lower Green River Riparian Aspect Priorities maps. (See Lower Green River Sun Maps 1-13 available at: https://www.kingcounty.gov/depts/drn:p/wlr/sections-programs/river-floodplainsection/ capital-projects/green-river-system-wide-improvement-framework/green-riverswi f-documents. aspx For example, landowners who allow a wide buffer of trees to grow along the river could be compensated with measures that enhance agricultural production on their remaining property, or alternative compensation as desired by the individual landowner. The Corridor Plan should discuss the potential for the FCD to negotiate individual landowner agreements and outline the steps needed to remove existing impediments to landowner agreements for the purpose of establishing shade as early as possible on priority agricultural lands in the lower Green River.

Response to T-2-34

Following the 2018-2019 scoping period, based in part on scoping comments received, the District developed three new alternatives. The new alternatives offer greater flexibility in acquisition and acquisition-related impacts, as described in PEIS Section 3.3 and Appendix A Section 4.2.3.

In addition, the final PEIS adds the acquisition of easements such as those described in the comment as a potential mitigation strategy for projects that have shading impacts, subject to project-specific compliance relevant land use regulations by the local jurisdiction.

Individual landowner negotiations are appropriate for project-level implementation.

Comment T-2-35

5. Repair or replace existing barrier culverts that prevent adult and juvenile salmon access to tributaries from the mainstem Green River within the planning area.

Response to T-2-35

Culverts, flap gates, and other impediments would be considered when applicable during project-level design and permitting.

A-1: WA Ecology, WDFW

COMMENTS RECEIVED ON THE DRAFT PEIS (A-1-1 THROUGH A-1-14)

Comment A-1-1

Dear Michelle Clark: Thank you for the opportunity to review and comment on the King County Flood Control District's (District) draft Programmatic Environmental Impact Statement for the Lower Green River Flood Hazard Management Plan (2023 DPEIS). Washington State Department of Ecology (Ecology) and Washington State Department of Fish and Wildlife (WDFW) appreciate the District's efforts in developing a long-term perspective for managing flood hazards throughout the Lower Green River corridor. We understand the complexity, urgency and importance in developing a plan to ensure necessary flood protection, economic viability, and ecological improvements within the Lower Green River Corridor. Overall, the proposed alternatives outline a framework that allows greater contrast of the alternatives to highlight the implementation of projects with multi-benefits, including water quality improvements and habitat restoration. As conveyed in our previous comments, Ecology and WDFW remain committed in supporting development of a long-term comprehensive corridor plan, that provides clear priorities that inform sustainable floodplain management actions well into the future[1]. With this letter, we acknowledge our support of Alternative 3, so investments can be made in the Lower Green to allow multi-benefit projects throughout this corridor. We highlight many of our earlier comments and offer new recommendations. Overall, however, Ecology and WDFW support identifying Alternative 3 as the preferred alternative in the final PEIS because it outlines an approach most likely to protect natural river functions and processes, to result in the most water quality improvements, and to support salmon recovery.

Response to A-1-1

Thank you for your comments. Your support of Alternative 3 is noted. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public. Your previous comments (3 documents) are included in this FEIS, Appendix H.

Comment A-1-2

Floodplain Management

In our 2019 PEIS comments, we identified the foundational goals and policies set forth in King County's 2006 Flood Hazard Management Plan. As King County works through the plan's 2024 update , the PEIS should continue to ensure consistency with these goals and policies of the updated Flood Hazard Management Plan. We are encouraged to see that Alternatives 2 and 3 in the 2023 DPEIS demonstrate a commitment to protecting natural functions and allowing natural river processes to occur. The DPEIS (2023) alternatives provide a strong approach to integrated floodplain planning, including the development of a new area-specific Flood Hazard Management plan and embracing a corridor-wide approach to floodplain management. We support Alternative 3 as providing the most potential impact to flood risk distribution and better alignment with multi-benefit goals, supporting projects emphasizing both habitat improvements and flood protection thought out the corridor.

[1] Comments were provided for the 2014-2016 System Wide Improvement Framework, the 2019 Lower Green River Corridor Plan/Programmatic Environmental Impact Statement Scoping, and the Lower Green River Flood Hazard Management Plan – Programmatic Environmental Impact Statement Scoping notice.

Response to A-1-2

With respect to the County's Flood Hazard Management Plan, as noted in PEIS Appendix A, Section 2.1., the 2006 King County Flood Hazard Management Plan serves as the Comprehensive Plan of Development for the King County Flood Control District. The Lower Green River Corridor Flood Hazard Management Plan would follow the policies of the 2006 King County Flood Hazard Management Plan. Please also refer to the response to comment A-1-1.

Comment A-1-3

We addressed several floodplain management issues in our 2019 PEIS scoping comment letter that we felt should be considered in the development of the final PEIS. In that regard, we would like to add the following notes to further clarify our previous comments. FEMA BiOp requirements across the local jurisdictions (Auburn, Kent, Renton, Tukwila, and Seattle) within the corridor. Additional notes: The King County Programmatic Habitat Assessment referenced in the draft only applies to unincorporated land under the County's jurisdiction. The cities have their own requirements they must meet under the BiOp: Renton and Tukwila are required to do a habitat assessment for every floodplain permit (Door 3); Kent and Seattle have their own programmatic approaches (Door 2); and Auburn has adopted the model ordinance for BiOp compliance (Door 1). We strongly encourage the Flood District to recognize and incorporate these differing approaches to BiOp compliance in Appendix C, Section 3.1.2 Plans and Policies.

Response to A-1-3

PEIS Appendix C Section 3 describes current flood hazard policies in Comprehensive Plans and floodplain management regulations in municipal codes. The final PEIS adds reference to the FEMA BIOp approaches of the jurisdictions in the study area.

Comment A-1-4

Evaluation of the zero-rise standards related to proposed project developments and the need to not transfer flood risk from one reach to another. Additional notes: Evaluating the transfer of flood risk is essential, and how this risk will be assessed should be included in the PEIS.

Response to A-1-4

PEIS Appendix B Section 3 compares modeling results for the three alternatives, describing changes in flooding at a programmatic level, regulatory requirements relating to the transfer of flood risk, and approaches to mitigation. Local regulatory requirements are also presented in PEIS Appendix C Section 3. The evaluation results are also summarized in PEIS Chapter 4.

More detailed assessments of the potential for changes in upstream and downstream flooding are best addressed during project-specific design, modeling, and permitting. The final PEIS Section 4.2 adds explanation of the role of hydraulic modeling during project implementation. This same information is summarized in the final PEIS Summary Section S.12.

Comment A-1-5

Consistency with channel migration zone development standards. Additional notes: Continue to consider this issue and address it in the final PEIS.

Response to A-1-5

Regulatory requirements applicable to channel migration zones are described in PEIS Appendix C Section 3.1.2. Compliance with these requirements is best addressed during project-specific design, modeling, and permitting.

Comment A-1-6

Recreation-related standards required by the cities within the corridor. Additional notes: Continue to consider this issue and address it in the final PEIS.

Response to A-1-6

Section S.3 of the PEIS Summary describes the goals and purposes of the Plan as providing an integrated and reasonable long-term approach to reduce flood risks within the corridor while balancing multiple objectives. These objectives are realized by supporting ten multibenefits, including recreation and other opportunities to connect people to nature. PEIS Section 5.1.7 describes at a programmatic level how recreation and other opportunities to connect people with nature could be realized through flood hazard management.

Comment A-1-7

Water Quality

Water quality would benefit most from the implementation of Alternative 3 because it offers the most opportunity to implement the recommendations of the Green River Temperature TMDL. Table 4-1 of Appendix F in the draft PEIS indicates that Alternative 3 is expected to result in substantial benefits to water quality and hydrology when compared to Alternative 2, which is expected to yield moderate benefits, and to Alternative 1, which is expected to result in moderate adverse negative impacts. The TMDL makes it clear that only when planting trees along the levees or when levees are set back to allow planting, will the water in the Green River have a chance to meet temperature water quality standards: Until the Corps of Engineers levee maintenance policy can be changed to allow the growth of a full riparian corridor, or levees set back to allow for planting, or until another mitigation approach can be successfully employed, temperatures will not meet state standards in the lower Green River. (p. XV) When projects result in unavoidable impacts, mitigation will be necessary. Ecology is encouraged that the KCFCD will prioritize TMDL recommendations when developing mitigation measures. Alternative 3 offers the most opportunity for engagement with partners in the Lower Green watershed.

Response to A-1-7

Thank you for your observations regarding the water quality analysis. Please refer to the response to comment A-1-1 regarding next steps.

Comment A-1-8

The subsequent development of a flood hazard management plan, if Alternative 3 is selected as the preferred alternative, should outline a process that the KCFCD will follow to engage stakeholders not only during the planning phase of projects but also after project implementation as part of adaptive management. Research shows that when stakeholders are continuously and purposefully engaged even after the implementation of an action, the project is more likely to foster public support and experience long-term success[2]

[2] Mussehl, M. L., Horne, A. C., Webb, J. A., & Poff, N. L. (2022). Purposeful Stakeholder Engagement for Improved Environmental Flow Outcomes. Frontiers in Environmental Science, 9. doi.org/10.3389/fenvs.2021.749864

Response to A-1-8

Alternatives 2 and 3 provide that "[T]the District would establish a process to periodically evaluate progress under the Plan based on established goals and indicators. The District would include Tribes, federal and state agencies, local jurisdictions, and stakeholders in the periodic review."

Comment A-1-9

Salmon Recovery

Alternative three is the only alternative that represents the needed investments to address the low Chinook juvenile carrying capacity in the Lower Green Corridor, that is directly limiting longer-term Chinook salmon recovery in the Green River. With the Federal Government projected investment of one billion dollars in the Howard Hansen Dam to restore fish passage and six hundred million in Lower Duwamish and East Waterway toxic clean ups, this will even further highlight this limiting factor. Without an enhanced systematic multi-benefit approach to significantly increase off channel restored habitat in the Lower Green corridor, the vast majority of Chinook juvenile salmon will continue to leave the Duwamish River as fry and not return. Chinook salmon that can find suitable rearing habitat within the river and grow larger (parr) before entering saltwater make up 95+ percent of returning adults yet they represent the vast minority, less than 7%, of the total juvenile salmon out migration.

Response to A-1-9

Thank you for your observations regarding salmon recovery as they relate to the evaluations in PEIS Appendix B Section 5. Please refer to the response to comment A-1-1 regarding next steps.

Comment A-1-10

Other Considerations

In March 2022, Ecology adopted revisions to its Water Quality Standards WAC 173-201A to provide additional water quality and habitat protection for early life stages of salmonids and their spawning gravel. As a result of these changes, new criteria for dissolved oxygen were adopted. Table 4-1 in Appendix B of the draft PEIS lists the numeric criterion for dissolved oxygen that was in place before this change and should be updated to reflect the new criterion of 10 mg/L or 95 percent saturation, as shown in WAC 173-201A-200(1)(d).

Response to A-1-10

The regulations and requirements presented in the PEIS were compiled in 2020. The most current regulations will be applied to project-specific permitting. The final PEIS adds a note to this effect where appropriate.

Comment A-1-11

The draft PEIS states that the determination for which type of facility is feasible at a particular location is dictated by the availability of space for restoration. The final PEIS should describe the general criteria that will be used to make determinations about space availability or if additional space must and can be secured.

Response to A-1-11

PEIS Appendix A Section 4.2.1 describes the space requirements for each facility type. PEIS Appendix A Section 4.2.3 describes the District's programmatic approach to application of these facility types and to acquisition for each alternative.

Comment A-1-12

Under all alternatives, approximately 600 to 900 homes managed by the King County Housing Authority or other affordable housing providers could experience flooding. The PEIS should indicate if any alternatives, especially the preferred alternative, may result in the displacement of homes for the County's low-income community members. To ensure that the tenets of environmental justice are supported, the PEIS and any following plans should outline steps that ensure that any such displacement will not result in adverse impacts.

Response to A-1-12

PEIS Appendix C Section 4.1.2 shows that all three of the alternatives would reduce the number of housing units flooded compared to existing conditions and discloses the number of units that could still experience residual flooding under each alternative. PEIS Appendix D Section 2.2.11.1 provides a more detailed assessment of the potential for affordable housing to continue to experience flooding. As described in PEIS Appendix C Section 5.2, "impacts associated with residual flooding are not the result of District actions." However, the section goes on to describe possible measures for addressing residual inundation. PEIS Section 3.3 notes that, as an element common to all three alternatives, the District would protect housing and community facilities used by historically disadvantaged populations by reducing flood risk with flood hazard management facilities, reducing the effects of flooding, or possibly relocating developments out of harm's way if the other approaches proved unsuccessful.

Comment A-1-13

It would be beneficial for the PEIS to break out the amount of industrial and residential acreage that will be affected by the different alternatives by city as well as watershed. This will allow for a better analysis of the impact projects have on each city and help distribute that impact.

Response to A-1-13

PEIS Appendix C Section 4.1 includes analysis of areas impacted including breakdowns by land use type and jurisdiction. See in particular Tables 4-3, 4-5, 4-6, and 4-7. The study area is entirely within the Lower Green River Corridor.

Comment A-1-14

Moving Forward

In closing, we would like to continue to work with the District to make sure the final PEIS and other future actions support multi-benefit approaches coupling increased flood protection with acceleration of water quality and habitat improvements aligned with salmon recovery goals throughout the Green/Duwamish River system. Ecology and WDFW continue to support the District's goal articulated in its FCD Motion FCD 21- 03 to balance flood protection, ecological improvements, and economic vitality. Instead of being perceived as mutually exclusive goals, they should be integrated into each of the alternatives considered in the PEIS. Since the PEIS articulates a long-term strategy, we urge the District to broaden its concept of economic vitality to include the full economic values of thriving Green River salmon and orcas throughout the Puget Sound.

Response to A-1-14

Thank you again for your comments.

ATTACHMENT: 2014 SYSTEM WIDE IMPROVEMENT FRAMEWORK (COMMENTS A-1-15 THROUGH A-1-22)

Comment A-1-15

Dear Chairman Dunn, Our agencies would like to express our sincere appreciation for including the State in the process to create a Green River System Wide Improvement Framework (SWIF). The SWIF project team has worked diligently to develop a considerable amount of technical analysis to inform thoughtful technical and policy discussions at the Technical Advisory Committee (TAC) and the Advisory Council (Council). We are optimistic that additional work planned for this fall will culminate in a work product that aligns flood management, habitat, water quality, and other social goals like recreation and public access for the important 21-mile stretch of the Green River. Consistent with the January 2014 vision statement, the SWIF is envisioned as a 50-year planning process designed to "improve flood protection for current and future generations, in a way that builds economic, ecological, and community resiliency." This is an ambitious, long-range goal that deserves a similarly ambitious program which clearly describes how the various interests will be met.

Response to A-1-15

Thank you for your ongoing participation in the work of the King County Flood Control District. Comments A-1-15 through A-1-22 are from a letter dated November 3, 2014, submitted pursuant to a separate process conducted from 2012 to 2014 for developing a System-wide Improvement Framework (SWIF). This earlier letter is included for reference because it was attached to comments on the draft PEIS submitted on June 20, 2023. The topics included in this letter are generally covered in other comments received from these agencies, specific to the PEIS. The development of PEIS alternatives is described in PEIS Appendix A. The evaluation of potential impacts to the natural and built environment is found in PEIS Appendices B and C, respectively.

Comment A-1-16

Given the economic importance and vitality of the Green River valley, State agencies support the proposal to elevate the level of flood safety, including the provisional 500-year Level of Protection at key locations. Inherent in this support is the understanding that the SWIF process will establish commensurate levels of protection for habitat and water quality. State agencies believe such protections will be essential for the Flood Control District, King County, and the cities in the Lower Green watershed to implement projects and obtain the necessary regulatory approvals, as well as avail themselves of innovative options now available for meeting mitigation requirements, such as the County's Mitigation Reserves Program. We are heartened by the most recent SWIF deliberations which indicate that such water quality and habitat commitments are forthcoming. State agencies remain committed to helping clarify how those interests can be met.

Response to A-1-16

Thank you for your comments.

Comment A-1-17

Following are some key policy themes that inform our thinking as we complete our work on the TAC and Council:

Optimize remaining and potential habitat opportunities. The project team's proposal to maintain existing flood control alignment (Alternative 1) for over 59% of the SWIF area reflects the highly modified and channelized system we have inherited and underscores the importance of optimizing any remaining protection and restoration opportunities. While Alternative 1 may allow for levee setbacks, laybacks, and vegetation strategies, the constrained channel severely limits habitat and water quality opportunity. As such, the State favors Alternative 3 – and, in some cases, Alternative 2 – alignments where possible. This alignment preference should be coupled with establishment of a "conservation area priorities" program. Again, recognizing that this is a 50-year planning process for flood protection, it should likewise be utilized as a 50-year program for water quality and habitat restoration. As discussed at the October 15 TAC, the conservation area priorities program will preserve some potentially higher cost sites for future acquisition and/or restoration in future Flood District capital program iterations.

Response to A-1-17

The alternatives referred to in this comment are from a SWIF planning process conducted from 2012 to 2014. Those alternatives are not the same as the alternatives evaluated in this PEIS. The development of the PEIS alternatives is described in PEIS Appendix A.

Comment A-1-18

Design and implement a vegetation strategy to meet water quality standards. The Washington State Department of Ecology's 2006 Total Maximum Daily Load (TMDL) for the Green River recommends 150-foot riparian buffers to improve temperatures by 5 – 9?F to provide habitat conditions suitable for endangered salmon. Recent pre-spawn mortality observed in the Green River and Soos Creek underscores the urgency of this work. As discussed at the TAC, implementing 150-foot buffers along the entirety of the lower Green is not practicable in some of the developed areas. However, TAC support for establishing a goal for such buffers, as well as development of an explicit vegetation management strategy, can significantly improve water quality conditions. Our agencies share a commitment to developing a provisional vegetation management strategy this fall, which would include how to incorporate recreation and public access objectives.

Response to A-1-18

Potential impacts to water quality are evaluated in PEIS Appendix B Section 4.3.

Comment A-1-19

Ensure Flood Control District capital program is considered and implemented in a watershed context. Considering the economic, ecological, and community objectives within a watershed context will provide the greatest opportunity to create synergy between the various interests and optimize the return on public investment. Doing so also lessens legal risks associated with meeting tribal and environmental obligations. The WRIA 9 salmon recovery plan and the Green River TMDL provide watershed approaches that can complement the planning, design, and implementation of the Flood District's capital program. Consequently, the State supports an explicit linkage between a coordinated flood improvement capital program with implementation of the habitat and water quality plans.

Response to A-1-19

Impacts to water quality and aquatic resources, including salmon, are evaluated in PEIS Appendix B Sections 4.3 and 5.6, respectively.

Comment A-1-20

Use watershed approach to leverage multiple fund sources. In addition to mitigation requirements that will be required as part of its capital program, the Flood District has the authority to make water quality and habitat investments as evidenced by the recent $4 million investment in the Cooperative Watershed Management Program. The district can coordinate and complement all its investments with other sources of habitat and water quality funding, such as Floodplains by Design, salmon recovery funding, the County's Mitigation Reserves Program, Ecology's stormwater funding, and the National Estuary Program. The State already has worked with partners to leverage some of these fund sources, and opportunity for multi-benefit projects is only likely to grow.

Response to A-1-20

The District can and does provide funding for water quality and habitat improvement projects. The role of the District vis-a-vis other agencies is described in PEIS Appendix A.

Comment A-1-21

Consider Climate Change Implications. To date, the implications of climate change have not been rigorously analyzed or incorporated into the SWIF process. Given the SWIF's 50-year planning horizon, climate change impacts should be incorporated into future planning to maximize the SWIF's durability.

Response to A-1-21

Climate change in relation to flood hazard management on the Green River is discussed in PEIS Appendix B.

Comment A-1-22

In sum, a SWIF that commits to implementing a multi-benefit, watershed program will be far more successful, permittable, and sustainable than the more traditional flood control programs. The Flood District has the authority to implement such a program, which would generate broad support from all levels of government and most other interests. We are confident that the Flood District embraces this path, and the State looks forward to helping further shape and implement this vision. This is a unique opportunity to leave behind a legacy of commitment for environmental restoration and flood protection that future generations will recognize as sound stewardship.

Response to A-1-22

Please see the response to comment A-1-17.

ATTACHMENT: 2019 SCOPING COMMENTS (COMMENTS A-1-23 THROUGH A-2-39)

Comment A-1-23

Dear Michelle Clark: Thank you for the opportunity to comment on the King County Flood Control District's (Flood District) Lower Green River Corridor Flood Hazard Management Plan (LGR Corridor Plan). The Puget Sound Partnership, Washington Department of Fish and Wildlife, Washington Department of Natural Resources, and Washington Department of Ecology (State Agencies) sincerely appreciate the Flood District's long-term perspective in managing flood hazards throughout the Lower Green River corridor. We similarly are committed to supporting a long-term integrated flood management approach ensuring flood protection, economic viability, and ecological improvements aligned with regional salmon recovery goals and consistent with applicable regulatory authorities.

Response to A-1-23

Thank you for your review and scoping comments, provided in 2019. These scoping comments were attached to comments submitted on the draft PEIS and are included here for reference (comments A-1-23 through A-1-39). Please note that after reviewing scoping comments received in 2019, the District developed three new alternatives and went through a second scoping process in 2021-2022.

Comment A-1-24

Regional and Statewide Interest in Recovery

Listing of Puget Sound Chinook salmon as "Threatened" in 1999 under the Endangered Species Act (ESA) stimulated a collective need for all interests from all corners of the Salish Sea to commit to recovery efforts and work collaboratively to save this iconic resource. This effort continues through 20 years of dedicated planning and investment targeted to salmon recovery throughout the state. Therefore, recovery of the Green River Chinook salmon population is not just a local issue, but is of regional and statewide importance, as it is essential to de-listing of Puget Sound Chinook and, moreover, a significant factor in avoiding further loss of the Southern Resident orca population. Urban development and flood intervention have essentially disconnected the Lower Green River from 82 percent of the historic floodplain, heavily degrading the river and salmon habitat over time. This reach, along with the Green-Duwamish Estuary, is characterized in the Puget Sound Chinook Recovery Plan as a critical barrier, limiting survivability of out-migrating juvenile salmon due to the lack of available rearing habitat within the corridor. The loss of riparian vegetation though this corridor has led to high (lethal) water temperatures, which has also created a breeding ground for five aquatic parasites that have further increased mortality rates for out-migrating juveniles and returning adult salmon. In 2009, after Chinook salmon yearly return numbers dropped to as low as 200 natural-origin adults, the Co-Managers (Washington Department of Fish and Wildlife and the Muckleshoot Indian Tribe) took costly measures to supplement the returning natural-origin Chinook runs by boosting hatchery production.

Response to A-1-24

As requested in your 2019 scoping comment, PEIS Appendix B Section 5 addresses aquatic resources and PEIS Appendix E addresses tribal matters.

Comment A-1-25

WRIA 9 Salmon Recovery Plan

In addition to the Co-Managers' efforts described above, other organizations, such as the Puget Sound Leadership Council, have been supporting the work of the Green-Duwamish and Central Puget Sound Watershed (WRIA 9) groups in their efforts to develop and implement a salmon recovery strategy for the Green River. WRIA 9, in collaboration with a diverse set of stakeholders, has partnered with King County and neighboring cities to develop a salmon recovery plan identifying specific recovery objectives at both a 10- and 50-year interval. Many of the proposed flood control measures listed in the PEIS appear to contradict with the WRIA recovery goals related to riparian habitat enhancements, reduction of bank armor, and establishment of off channel habitat. Therefore, to ensure alignment with state and regional recovery efforts, it is imperative the Flood District work collaboratively with the leaders of WRIA 9 in development of PEIS alternatives that support ongoing work to recover salmon in the watershed.

Response to A-1-25

After reviewing scoping comments received in 2019, the District developed three new alternatives and went through a scoping process again in 2021-2022. Please refer to Appendix B Section 5.6.1.5 for an evaluation at a programmatic level of how each alternative could generally contribute to the WRIA 9 objectives. The District is a primary funder for WRIA 9 and supports salmon habitat projects done by WRIA 9 in the Lower Green River Corridor and elsewhere. The District can and does collaborate on the approach to habitat protection and recovery with Tribes, federal and state agencies, and local jurisdictions.

Comment A-1-26

Connections to Orca Recovery

As part of the federal response to the decline in the Southern Resident orca population, the Governor's Orca Task Force recommended an increase in production of hatchery Chinook, for which the Green River hatchery system plays a key role implementing immediate and moderate response efforts. In fact, the Washington Department of Fish and Wildlife's Green River Hatchery facility plans to increase hatchery Chinook releases by fifty percent. These Green River Chinook are expected to contribute twenty percent of the estimated needed lift in adult Chinook prey for Southern Resident orcas. Therefore, it is critically important the LGR corridor provide sufficient salmon habitat to support these out-migrating Chinook targeted as orca prey. Moderate to long-term Orca Task Force actions call for an increase in salmon recovery investments with additional funding for restoration project brought forward through groups like the Salmon Recovery Funding Board. Therefore, the Flood District's commitment to a multi-benefit approach identifying habitat improvements and restoration opportunities could align the flood hazard planning effort with this funding opportunity, while also confirming the County's commitment to threatened salmon and orca recovery.

Response to A-1-26

Thank you for your comment. Since the 2019 scoping period, the District has adopted a set of multibenefits which include "Habitat Protection and Salmon Recovery". The multibenefit policy is summarized in PEIS Section 2.4 and described in more detail in Appendix A Section 2.1.2. The manner in which the multibenefits could be realized under each alternative is described in Chapter 5 of the PEIS.

Comment A-1-27

State Agencies' PEIS Recommendations:

Build on Previous Efforts and Past Commitments

The State Agencies remain committed to long-term sustainable management of the Green River corridor. We actively contributed to the 2014-2016 Green River System Wide Improvement Framework (SWIF). Unfortunately, the SWIF was not completed consistent with the original vision (provided below). However, the Flood District's current effort in establishing a corridor plan is the right opportunity to reincorporate the original long-term, multi-benefit vision into the PEIS. "Improve flood protection for current and future generations, in a way that builds economic, ecological, and community resiliency." 2014 SWIF Vision Statement. As established in Resolution FCD 2016-05, the Flood District's adoption of the "Interim SWIF" in 2016 only incorporated some elements of the original SWIF vision. However, as stated in the Flood District's 2016 transmittal of the interim SWIF, the Board of Supervisors committed to integrate habitat and recreation objectives left out of the interim SWIF into a future corridor plan, such as the proposed PEIS. "Pursuing an Interim SWIF is a short-term solution to retain eligibility under the P.L. 84-99 rehabilitation assistance program, and does not meet all of the goals and objectives of the stakeholders for a Green River vision that includes flood protection, levee certification, habitat, and recreation. The Flood District is committed to achieving these additional goals in a long-range Lower Green River Corridor Plan that will integrate elements of the Interim SWIF and which we plan to scope in conjunction with a programmatic environmental impact statement under SEPA." 2016 Interim SWIF Transmittal (emphasis

added). Therefore, the Flood District needs to follow through on this commitment and incorporate habitat-related elements into the proposed LGR Corridor Plan, which unfortunately do not appear to be reflected in the current PEIS.

Response to A-1-27

These comments were provided on the 2018-2019 scoping process, rather than on the draft PEIS. After reviewing the scoping comments, the District developed three new alternatives for evaluation in the PEIS. The manner in which habitat elements could be incorporated into the alternatives is described in PEIS Appendix A Sections 4.2.1.1, 4.2.3, and 4.5. The results of the evaluations relating to habitat are presented in PEIS Appendix B Section 5 and summarized in PEIS Chapter 4.

Comment A-1-28

Multi-Objective Goal Not Reflected in Proposed Alternatives

The proposed LGR Corridor Plan is broadly described within the PEIS scoping documents as intended to "…provide an integrated and reasonable long-term approach to reduce flood risk within the Lower Green River Corridor while balancing multiple objectives within the study area…while supporting the economic prosperity of the region and improving fish habitat." Inconsistent with this description, the PEIS alternatives focus on a singular objective to reduce flood hazards, with little reference or commitment to other objectives, such as habitat or water quality improvements.As conveyed by State Agencies4 through the SWIF process, we recognize the importance of maintaining economic vitality within the Green River Valley and continue to support elevation of flood protection to a 500-year level at certain locations. However, inherent in this support is the understanding that commensurate levels of habitat and water quality improvements will also be included. Therefore, all of the PEIS alternatives need to include habitat and water quality enhancements in alignment with regulatory requirements and regional interests. Incorporation of these elements is not only necessary for transparency in PEIS development but also will be required as compensatory mitigation as flood protection projects are implemented.

Response to A-1-28

Please see response to comment A-1-27. Impacts on water quality are presented in PEIS Appendix B Section 4. The way in which the multibenefits of habitat and salmon recovery and clean and sustainable water could be realized by each alternative are presented in PEIS Chapter 5.

Comment A-1-29

Recommend Clear Project Purpose and Corresponding Objectives

An integrated flood hazard corridor plan for the Lower Green River must clearly articulate the complete suite of objectives into the project purpose statement, goals, and corridor plan objectives. Therefore, the PEIS should be amended to integrate specific goals and objectives related to habitat enhancements and salmon recovery, or a new fourth alternative, as requested by WRIA 9, needs to be developed. The 2016 Vision, Goal and Objective statement developed for the SWIF process serves as a good example. At a minimum, the following SWIF goals should be carried forward in the PEIS: Integrated river and floodplain management - Reach agreement on an integrated list of multi-objective, prioritized projects and non-regulatory, programmatic actions that achieve the Green River SWIF's agreed to goals for level of protection from flooding. This integrated set of flood protection strategies and actions shall: (a) improve water temperature; (b) advance progress towards meeting salmon protection and recovery goals; (c) enhance open space, recreation, treaty fishing, and public access; (d) support farmland protection, resiliency and productivity; and (e) reduce long-term facility maintenance costs. Vegetation management - Develop shoreline and levee vegetation management recommendations to further the goals of the ESA, CWA, and Corps PL84-99 standards. Ecological resilience - Improve the ecological resilience of the Lower Green River's aquatic and terrestrial habitats through implementation of the Green River SWIF's priority projects and non-regulatory, programmatic recommendations.

Response to A-1-29

These comments were provided on the 2018-2019 scoping process, rather than on the draft PEIS. After reviewing the scoping comments, the District developed three new alternatives for evaluation in the PEIS. The goals and purpose of the Plan are presented in PEIS Summary Section S.3., Chapter 2 Section 2.4, and Chapter 3 Section 3.2.

Comment A-1-30

Narrow Consideration of Facility Types and Constraints

The PEIS is characterized as a long-term, non-project environmental review. However, the section describing the four facility types provides very specific flood protection perimeters and site-level constraints that fundamentally limit the feasibility of habitat improvements. We recognize certain segments of the corridor are constrained due to existing development. However, long-term, multi-benefit aspects of the environmental review should not foreclose potential opportunities to work through these challenges. For example, currently, many of the urban physical constraints are single-story commercial buildings or parking areas that contribute significant economic benefits to the regional economy but also limit opportunities to restore floodplain functions through a setback levee or similar treatment. Even though the economic value of these buildings today is tied to a single-story warehouse use, we should not foreclose the possibility that future land-use demand will change over the next 25 or 50 years. A local jurisdiction could potentially incentivize redevelopment of existing single-story (large footprint) structures into smaller-footprint, higher structures that maintain (or increase) local tax base, while also creating opportunities to restore or reconnect the floodplain over the long term.

Response to A-1-30

These comments were provided on the 2018-2019 scoping process, rather than on the draft PEIS. After reviewing the scoping comments, the District developed three new alternatives for evaluation in the PEIS.

Comment A-1-31

Uncertain Regulatory Alignment, Permit Appeal Risk

The PEIS lacks necessary analysis considering if the proposed alternatives are consistent with applicable regulatory programs. According to Ecology's SEPA Handbook, in defining a "proposal" it is necessary to determine what permits or approvals will be needed from state, local, and federal agencies. The Flood District should identify permits or approvals that will be required under each alternative, along with consideration of the degree of regulatory alignment between the proposed alternatives. Similarly, SEPA requires identification of mitigation that will be required by applicable development regulations under WAC 197-11-158 and 330(1)(c). However, the PEIS does not identify mitigation required under each alternative. Further, with a high likelihood of third-party appeal of decisions issued by local governments or state agencies for flood control structures, it is important for the Flood District to propose self-mitigating projects tied to a comprehensive flood hazard management plan, providing a sound basis for future regulatory decisions. In light of these factors, it is imperative the Flood District include multi-benefit projects that consider floodplain storage, salmon recovery goals including temperature TMDL implementation, treaty rights, facility lifecycle costs, and resilience to climate change in scoping the PEIS.

Response to A-1-31

This comment was submitted during the 2018-2019 scoping process. Because the PEIS had not yet been prepared, these comments were taken as suggestions for what should be included in the PEIS. The regulatory framework for the alternatives is described at a programmatic level in the PEIS.

Comment A-1-32

The following section provides a brief synopsis of questions or concerns regarding potential inconsistencies between the PEIS alternatives and applicable regulatory authorities, including local/state/federal floodplain management requirements, the state Shoreline Management Act, the federal Clean Water Act and the Washington Water Pollution Control Act, and the State Environmental Policy Act.

Floodplain Management

King County's 2006 Flood Hazard Management Plan identified the following foundational goals to be followed in their management of designated flood areas: 1. To reduce the risks from flood and channel migration hazards. 2. To avoid or minimize the environmental impacts of flood hazard management. 3. To reduce the long-term costs of flood hazard management.

Response to A-1-32

Please see the response to A-1-27 regarding PEIS alternatives. In addition, PEIS Appendix A Section 2.1.1 explains that a flood hazard management plan for the Lower Green River would be an area-specific plan under the 2006 King County Flood Management Plan and follow the relevant policies.

Comment A-1-33

Portions of the 2006 plan were updated in the County's 2013 Flood Hazard Management Plan, including adoption of the following multi-benefit policies the PEIS should be consistent with: Policy G-3 Comprehensive River & Flood Hazard Management - King County should provide comprehensive river and flood hazard management through the implementation of projects and programs that result in multiple benefits, including those created by meeting any or all of the following non-prioritized objectives, including (e) protect and, where possible, enhance aquatic and riparian habitat in a manner consistent with adopted salmon habitat recovery plans. Policy G-10 Protecting Natural Functions & Values - King County shall protect flood storage, conveyance, and ecological values of floodplains, wetlands, and riparian corridors and, when feasible, should enhance or restore these ecological functions and values. Flood risk reduction strategies and projects should be coordinated on a river-reach scale with the salmon habitat recovery plans. Policy PROJ-6 Flood Protection Facility Design & Maintenance Objectives - King County should construct new flood protection facilities and maintain, repair or replace existing flood protection facilities in such a way as to: (a) require minimal maintenance over the long term; (b) ensure that flood or channel migration risks are not transferred to other sites; (c) protect or enhance aquatic, riparian and other critical habitats; and (d) protect or enhance multiple beneficial uses of flood hazard areas. Policy PROJ-7 Flood Protection Facilities within Critical Areas Ordinance Aquatic Areas and Aquatic Area Buffers - Wherever possible, King County should relocate existing flood protection facilities farther from the river edge and associated buffers to increase flood conveyance and allow natural river processes to occur.

Response to A-1-33

Please refer to the response to comment A-1-32 regarding the 2006 flood hazard management plan.

Comment A-1-34

Below is a number of other floodplain management related questions that should be considered in development of the PEIS scope and consideration of alternatives:

1. FEMA BiOp6 requirements across the local jurisdictions (Auburn, Kent, Renton, Tukwila, and Seattle) within the corridor.

2. Evaluation of the zero-rise standards related to proposed project developments and the need to not transfer flood risk from one reach to another.

3. Consistency with channel migration zone development standards.

4. Recreation-related standards required by the cities within the corridor.

Response to A-1-34

Please refer to the responses to comments A-1-3 through A-1-6.

Comment A-1-35

Puget Sound Partnership - Floodplain Implementations Strategy

Working in collaboration with many partners, the Puget Sound Partnership developed an Implementation Strategy for integrated floodplain management that balances the need to maintain flood protection in alignment with regional recovery goals. We strongly encourage the Flood District to incorporate relevant recommendations from this strategy into the PEIS.

Response to A-1-35

In FCD Motion 20-07, the District adopted policies based on integrated floodplain management. These policies are embedded in the alternatives evaluated in the PEIS.

Comment A-1-36

Shoreline Management Act

The Green River flows through several cities, including Auburn, Kent, Renton, Tukwila, and Seattle. All of these jurisdictions have local Shoreline Master Programs (SMPs) with policies and development regulations applicable to flood protection actions contemplated in the PEIS, yet the PEIS does not provide any reference or consistency analysis of the flood hazard reduction projects described under the three PEIS alternatives in comparison to applicable SMP provisions. Local and, in some cases, state authorization will be required for project actions located in shoreline jurisdiction (i.e. aquatic areas and 200 feet upland of the ordinary high water mark). The Flood District will need to demonstrate consistency with applicable development standards for the permit to be approved. Therefore, we strongly recommend consistency with local SMP policies and regulations be incorporated as a key screening criteria in scoping of the PEIS alternatives. The Green River is characterized as a shoreline of statewide significance under RCW 90.58.030, as the mean annual average flow is greater than 1,000 cubic feet per second. Areas designated as shorelines of statewide significance are recognized at the planning level through development of SMP provisions aligned with the core policies of the Shoreline Management Act, as well as through individual project review, requiring consistency with the following criteria:

-Recognize and protect statewide over local interests.

-Preserve the natural character of the shoreline.

-Result in long-term rather than short-term benefits.

-Protect shoreline resources and environment.

-Increase public access to publicly owned shoreline areas.

-Expand recreational shoreline opportunities for the public.

In addition, each of the local SMPs has been developed to maintain no net loss of shoreline ecological functions. Many of the flood protection actions identified in the PEIS may not align with applicable SMP provisions or would require a significant level of mitigation to offset anticipated impacts. Therefore, since shoreline permit authorizations will be needed for many of the proposed flood control actions, analysis of consistency with applicable SMP provisions should be clearly articulated in the PEIS to fairly evaluate the range of alternatives under consideration.

Response to A-1-36

The Shoreline Management Act provisions for jurisdictions on the Lower Green River are described and evaluated in PEIS Appendix C, sections 3.1.3 and 4.

Comment A-1-37

Clean Water Act – Washington Water Pollution Control Act

The Washington Department of Ecology's 2011 Temperature - Total Maximum Daily Load (TMDL) Water Quality Improvement Report7 for the Green River indicates lack of mature vegetation along the levee-buffered Lower Green is causing exceedances of state water quality standards. These temperature exceedances subject ESA-listed species to lethal water temperatures and compromise significant investments that have been made for recovery efforts. The report concludes 150-foot riparian buffers along the entire corridor are in fact necessary to reduce water temperature by 3 – 5? C to ensure habitat conditions suitable for ESA-listed salmon. The TMDL report also emphasized the importance of the United States Army Corps of Engineers' maintenance policy supporting vegetated levees or levee setbacks that include vegetation enhancements as essential to meeting temperature water quality standards. As discussed during the SWIF, implementing 150-foot buffers along all of the developed areas of the Lower Green may not be practicable. However, considering the long-term nature of the LGR Corridor Plan, the Flood District should not preclude projects with the potential to decrease water temperature and improve water quality. In addition, we recommend the Flood District fully assess future levee modifications with respect to the Riparian Aspect Mapping effort ("Sun Map") completed by the Muckleshoot Indian Tribe in 2013 and integrated into the Interim SWIF. Therefore, the LGR Corridor Plan should reevaluate levee vegetation management guidelines and/or alternate levee setback locations that do not preclude reestablishment of functional riparian habitats where they may be feasible – especially where proposed levee alignments intersect with "high potential shade" areas.

Response to A-1-37

As noted in your comment A-1-7 on the draft PEIS, the Total Maximum Daily Loads (TMDLs) for the Lower Green River are considered in the PEIS (please refer to PEIS Appendix B Section 4 and Appendix F).

Comment A-1-38

State Environmental Policy Act

The Flood District has prepared this PEIS pursuant to SEPA requirements under RCW 42.21C.030(2)(c). The PEIS is generally characterized as a "non-project proposal that is likely to have significant adverse impacts on the environment." Ecology's SEPA Handbook distinguishes "project" from "nonproject" actions through the following definitions: Project actions are agency decisions to license, fund, or undertake a specific project. Nonproject actions are agency decisions on policies, plans, and programs, including adoption or amendment ordinances, regulations that will regulate future projects, or capital budgets…etc. Based on these definitions and the proposal description provided in the PEIS notice, the State Agencies assume the Flood District is planning to run a separate environmental review for individual project actions, where project-level details will be described and evaluated in a manner that can support implementation of specific project actions.

Response to A-1-38

Your comment reflects the SEPA review process the District expects to follow.

Comment A-1-39

Moving Forward

In closing, the State Agencies would like to continue to work with the Flood District to make sure ongoing EIS developments and other future actions support or accelerate, when possible, the recovery of salmon in the Green/Duwamish River system. Flood protection, ecological improvements, and economic vitality should not be perceived as mutually exclusive goals, but rather should be integrated into each of the alternatives considered in the PEIS. Since the PEIS articulates a long-term strategy, we urge the Flood District to balance the need for economic vitality with the need to provide thriving salmon runs for orcas

and fishermen alike, now and into the future.We remain confident the Flood District's commitment to a multi-benefit approach will have both short- and long-term benefits. In the short term, implementation of individual project actions could be streamlined by upfront demonstration through the PEIS of individual project connections to the overall objectives of the LGR Corridor Plan. In the long term, a multi-benefit approach will ensure community values are protected within the corridor and resilience to unforeseen challenges is increased.

Response to A-1-39

Thank you for your comments.

ATTACHMENT: 2022 SCOPING COMMENTS (COMMENTS A-1-40 THROUGH A-1-53)

Comment A-1-40

Dear Michelle Clark:

Thank you for the opportunity to review and comment on the King County Flood Control District's (District), Lower Green River Flood Hazard Management Plan – Programmatic Environmental Impact Statement Scoping (PEIS-Scoping) notice. The Puget Sound Partnership, Washington Department of Fish and Wildlife, and Washington Department of Ecology (State Agencies) sincerely appreciate the District's efforts in developing a long-term perspective for managing flood hazards throughout the Lower Green River corridor. We understand the complexity, urgency and importance in developing a plan to ensure necessary flood protection, economic viability, and ecological improvements within the Lower Green River Corridor.

Response to A-1-40

Thank you for your review of the scoping notice. Comments A-1-40 through A-1-53 are from a letter dated February 4, 2022, submitted during the 2021-2022 scoping period.

Comment A-1-41

Overall, the alternatives proposed in the scoping phase of the PEIS outline a framework that allows for the implementation of projects with multi-benefits, including water quality improvements. This is a much-needed improvement over the alternatives included in the initial LGR Corridor Plan and the Flood District should be commended for its FCD20-07.1 motion that documents its commitment to integrated floodplain management and multi-benefit projects.

Response to A-1-41

Thank you for your support of the District's multibenefit motion and three new PEIS alternatives.

Comment A-1-42

As conveyed in our previous comments during the 2014-2016 System Wide Improvement Framework (SWIF) and the 2019 Lower Green River Corridor Plan/Programmatic Environmental Impact Statement (2019 PEIS) comments, the State Agencies remain committed in supporting development of a long-term comprehensive corridor plan, that provides clear priorities that inform sustainable floodplain management actions well into the future. With this letter, we highlight many of our earlier comments and offer new recommendations.

Response to A-1-42

Thank you for your comments.

Comment A-1-43

Consider previous comments submitted by the State Agencies

The State Agencies perspective on "Regional and Statewide Interests in Recovery", support for implementation of the "WRIA 9 Salmon Recovery Plan" and emphasis describing "Connections to Orca Recovery" have not changed from the comments provided to the District in 2019, which we request be considered in developing the Programmatic Environmental Impact Statement.

We also request that the District consider other elements of our previous comments provided through the 2014-16 SWIF and 2019 PEIS. We have enclosed our previous comments to the end of this letter.

Response to A-1-43

State Agencies' comments on the draft PEIS included both of the above-referenced documents as attachments, and responses are provided (see comments A-1-15 through A-1-39 and associated responses).

Comment A-1-44

The State Agencies would like to highlight the following recommendations and considerations from our 2019 comment letter for the previous scoping period:

- Narrow consideration of facility types based on reach or parcel specific constraints.

Response to A-1-44

PEIS Appendix A Section 4.2.1.1 describes how habitat and other multibenefits can be realized within the context of the different facility types. The evaluations in the PEIS consider how the facility types could be applied within the framework of the three alternatives. The results relating to habitat are provided in PEIS Appendix B Section 5, and results relating to water quality are provided in PEIS Appendix B Section 4. The results regarding how the ten multibenefits could be realized are provided in PEIS Chapter 5.

Comment A-1-45

- Consider regulatory alignment with SEPA, Floodplain Management, Shoreline Management and Clean Water Act/Washington State's Water Pollution Control Act. To truly provide a "comprehensive" review, as emphasized in FCD Motion FCD21-03, the District will need to include a meaningful and detailed consideration of these applicable authorities within the PEIS.

Response to A-1-45

Please refer to responses provided for comments A-1-33 through A-1-38.

Comment A-1-46

- Address essential water quality needs – The Washington State Department of Ecology addressed temperature impairments in the Temperature Total Maximum Daily Load (TMDL) Water Quality Improvement Report for the Green River[1] (2011) and found that lack of mature vegetation along more than 50% of the levee-buffered Lower Green is causing exceedances of state water quality standards. These temperature excursions subject ESA-listed species to lethal water temperatures and compromise significant investments that have been made for water-quality recovery efforts. The report concludes 150-foot riparian buffers along thede entire corridor are necessary to reduce water temperature by 3 – 5 C and thus prevent harm to ESA-listed salmon. The TMDL report also emphasizes the importance of the United States Army Corps of Engineers (USACE) maintenance policy supporting vegetated levees or levee setbacks that include vegetation enhancements as essential to meeting temperature water quality standards.

Response to A-1-46

Please refer to the response to comment A-1-37.

Comment A-1-47

Continue refinement of multi-objective goal(s) in proposed alternative(s)

The State Agencies appreciate the District's renewed effort listing "Multi-Benefit" as a core element in the Scoping PEIS. To properly integrate a "Multi-Benefit" approach, the State Agencies recommend that the District clearly define specific "Multi-Benefit" elements or framework demonstrating commitments made through Motion FCD 20-07 related to integrated floodplain management and multi-benefit projects. To facilitate this process, we suggest that the District consider the Department of Ecology's recently updated 2021 publication Comprehensive Planning for Flood Hazard Management: A Guidebook[2].

Response to A-1-47

PEIS Chapter 5 defines the ten multibenefits and how they could be realized through the three alternative approaches to flood risk management.

Comment A-1-48

Of particular relevance to the multi-benefit approach is the District's commitment to habitat improvements within the corridor. As affirmed during the SWIF process and reiterated through our 2019 PEIS comments, the general agreement remains that any agreed-upon level of flood protection will not preclude a commensurate level of habitat and water quality improvements from being included in the plan. The current Scoping PEIS appears to reference a level of protection described as: "18,800 cfs, plus three feet of freeboard", which we understand to be generally consistent with the previously referenced "500-year" level of protection listed in the 2019 PEIS.

We request that the District confirm our assumption that these two levels of protection are equivalent. Therefore, as stated in our 2019 PEIS comments, we continue to strongly recommend that all of the PEIS alternatives include habitat and water quality enhancements in alignment with regulatory requirements and regional interests. Incorporation of these elements is not only necessary for transparency in PEIS development but also will be required as compensatory mitigation as flood protection projects are implemented.

---

[1] https://apps.ecology.wa.gov/publications/documents/1110046.pdf. The Green River Temperature TMDL uses the applicable temperature criteria for the designated aquatic life uses defined in WAC 173-201A-200(c) and 173-201A-602.

[2] Washington State Department of Ecology. 2021. Comprehensive Planning for Flood Hazard Management: A Guidebook. Publication # 21-06-019. Available online at: https://apps.ecology.wa.gov/publications/documents/2106019.pdf.

Response to A-1-48

Please refer to the response to comment A-1-44.

Comment A-1-49

Provide additional details on project alternatives

The State Agencies want to express general support and preference for Alternative 3, as it appears to be most aligned with statewide interests described in this letter, though as pointed out below, more details are necessary. For sites where Alternative 3 is not feasible, we recommend that the District create a different evaluation process engaging multiagency teams to assess the highest level of attainable multi-benefits. In addition to our stated preference for pursuing Alternative 3, we are providing the following recommendations to further enhance the draft alternatives in the PEIS:

- Develop a clear project purpose and corresponding objectives. Differences between Alternatives #2 and #3 in the current PEIS are difficult to distinguish. We suggest that the District develop clear purpose statements and distinct objectives to better inform the intended trade-offs associated with Alternatives #2 and #3.
- Detailed descriptions of alternatives are needed: The alternatives listed in the PEIS Scoping notice do not provide a sufficient level of detail to properly inform ecological impact distinctions and potential mitigation needs associated with each option. The District should distinguish the alternatives considering a wide range of categories of information to:
    - Prioritize certain geographic areas or reaches within the corridor, or identify subalternative implementation timelines that set expectations on progress to be achieved over defined time periods.
    - Outline the parameters that define the extent to which planting riparian vegetation is "practicable" considering that the Green River TMDL found that a continuous 150-foot buffer is the only condition under which water quality standards for temperature can be met.
    - Where riparian vegetation cannot be planted, consider other approaches to offset the warming of the river waters by creating cold-water refuges via the strategic placement of large woody debris, improving floodplain connections, and improving shade in non-natal tributaries to the Lower Green River.
    - Commit to mitigation for lost shade within a reasonable amount of time (e.g., 10-20 years) and spatial distance.
    - Maximize benefits and reestablish functional riparian habitats, especially where future levee projects intersect with critical and high potential shade areas.

Using such a level of specificity in outlining each alternative, even at this programmatic planning phase, would be helpful to the public in gaging which alternative is preferable and yields the desired set of benefits.

Response to A-1-49

Please refer to the response to comment A-1-37 regarding the goals and purpose of the Plan. The alternatives are described in detail in PEIS Appendix A Section 4.2.3. PEIS Chapter 3 includes tables and visualizations to compare and contrast the three alternatives in different situations. PEIS Appendix B provides ecological impact evaluations and describes a programmatic approach to mitigation.

Comment A-1-50

- Support for comprehensive/systematic approach: The State Agencies do not support a case-by-case approach, as conveyed in Alternative 1. Instead, we strongly recommend that the District include a comprehensive assessment of shade deficiency on water temperatures, salmonid health and comparison of other important elements considered through the multi-benefit approach.

Response to A-1-50

Your position on Alternative 1 is noted. Water quality, including temperature, is addressed in PEIS Appendix B Section 4.

Comment A-1-51

- Emphasis on floodplain and riparian management: The 2021 State of the Sound report calls for an increase in floodplain and riparian restoration to increase climate resilience by decreasing flood risk during extreme rain events and providing shade to offset warming streams (2021 State of the Sound, pg. 48). Working in collaboration with many partners, the Habitat Strategic Initiative Lead developed the Floodplains and Estuaries Implementation Strategy (webpage and narrative) to describe the steps to accelerate progress towards Puget Sound recovery goals through integrated floodplain and estuary management and river-basin level planning.

Response to A-1-51

Please refer to the response to comment A-1-35.

Comment A-1-52

Climate change

We appreciate the District's reference to continued study of climate change as a core element listed in the PEIS Scoping notice. In addition, the State Agencies recommend that the District consider the following in the development of the PEIS:

- To support the established habitat goals for the Lower Green, the State Agencies request all District flood control projects consider current and future (based on year 2122) modeled flow events to minimize potential negative long-term effects.
- Identify and create larger scale multiple use staged flooding areas to allow greater water storage to decrease water velocities.

Response to A-1-52

Please refer to the response to comment A-1-21.

Comment A-1-53

Moving Forward

In closing, the State Agencies would like to continue to work with the Flood District to make sure the PEIS, the Plan, and other future actions support and accelerate the recovery of salmon in the Green/Duwamish River system.

The State Agencies support the District's goal articulated in its FCD Motion FCD 21-03 to balance flood protection, ecological improvements, and economic vitality. Instead of being perceived as mutually exclusive goals, they should be integrated into each of the alternatives considered in the PEIS. Since the PEIS articulates a long-term strategy, we urge the Flood District to broaden its concept of economic vitality to include the full economic values of thriving Green River salmon and orcas throughout the Puget Sound.

Response to A-1-53

Thank you for your offer. The District looks forward to continuing to work with you.

B-1: Tenerelli Properties

Comment B-1-1

Of the 10 seeming priorities I don't see the simple "protect people's lives and livelyhoods." "Jobs and Sustainable Livelyhoods" comes close.

Response to B-1-1

Thank you for your comments. PEIS Appendix A Section 2.1 describes the District's primary objectives and regulatory authority, which relate to funding and policy oversight for projects and programs that protect people and property from flood water damage. The ten multibenefits are inter-related interests to be advanced where applicable in addition to flood protection.

Comment B-1-2

After 27 years working in Kent and being exposed to the destructive nature of flooding I strongly suggest a more aggressive approach to "dredging out" Mill Creek and other natural waterways that traverse through Kent (and other adjoining municipalities) in order to give flood waters a quicker and easier path to dispurse once flooding begins....and looking at snow pack the current weather patterns this might be the year we see a breach in the fairly new levees and a flooded down town if Howard A. Hanson Dam can't handle it. Water creatures are amazingly adaptable and in my opinion any dredging will have a neglible overall affect and animal life will bounce back very quickly. While working for the Seattle Engineering Department in the 1970's during at least one 100 year storm and working mitigation following.....I was responsible for dredging operations on Victory and Thornton Creeks in Seattle and I can personally attest to my observation and statement above. I have not seen Mill Creek in Kent for some time and perhaps such "clean up" has been done since I retired in 2013 but last I observed there was what I consider to be moderate to severe eutrophication taking place which has its own issues with lack of oxygen due an overgrowth of plant life.....

Response to B-1-2

Thank you for the suggestion. District actions must comply with a variety of regulations and reviews applicable to a river corridor. As the District Board of Supervisors determines its next steps, all comments will be considered.

Comment B-1-3

and how does one define "Equity and Social Justice" as it relates to flood control?

Response to B-1-3

Equity and social justice is one of the ten multibenefits that could be implemented in conjunction with flood hazard management. PEIS Chapter 5 defines equity and social justice as the fair treatment and meaningful involvement of all people regardless of race, color, ethnicity, religion, income, or education. The District could further equity and social justice by engaging historically disadvantaged populations in flood hazard management planning.

Comment B-1-4

For the record my Rental Tri-Plex was constructed in 1906 and is in the downtown floodplain and the property was often flooded before the dam was constructed. I also managed levee construction within the Kent City limits during my employment.

Response to B-1-4

Thank you for your comment.

B-2: Starfire Sports

Comment B-2-1

Dear Ms. Clark: Under Alternative 3 it is stated where there are flood protection facilities that are not part of the federal PL 84-99 program, the district "would leave the existing levee in place, but would otherwise do nothing, allowing the area to inundate". This may be a sound policy for some situations, but we need the district to include flexibility because there are instances where an exception is necessary.

Response to B-2-1

Please refer to the desciption of Alternative 3 in PEIS Chapter 3 Table 3-3. This table shows that the District's approach when there are existing non-PL 84-99 facilities is to apply a hierarchy. While the preferred approach under Alternative 3 is to consider acquisition first and then flood proofing, improvements to the existing flood protection facilities are not excluded. In the circumstances near the Starfire Complex, all three alternatives would in fact improve the existing faciliies. The inundation shown in this area on the maps in Chapter 4 would be addressed through project-specific modeling and design.

Comment B-2-2

Starfire Sports is located in an area described above and as a nonprofit that serves over 1.3 million people a year and focuses on the underserved, underrepresented and children of our community it would be impossible to relocate or provide these services another way. I appreciate the work the district is doing to reduce flood risk in the Lower Green River Corridor. Please contact me at beno@starfiresports.com or (206) 267-7417 if you have any questions.

Response to B-2-2

Thank you for the information and for your comments. Recreation and equity and social justice are addressed in PEIS Appendices C and D, respectively.

IG-1: WRIA 9 Watershed Ecosystem Forum

Comment IG-1-1

Dear Ms. Clark: The draft Lower Green River Corridor Flood Hazard Management Plan (Corridor Plan) presents a once-in-a-generation opportunity to holistically approach flood management to protect lives and property in a manner that supports a climate-resilient watershed, resilient salmon populations, robust economic development, diverse recreational opportunities, and improved quality of life for residents within the Lower Green River valley. A Corridor Plan that operationalizes integrated floodplain management to consistently deliver multi-benefit projects – consistent with the commitments in the Flood Control District's Motion FCD20-07.1 – is essential to realizing this vision for the Lower Green River valley and meeting our collective obligation to restore ESA listed salmon populations.

Response to IG-1-1

Thank you for your comments. Please refer to the responses to your specific comments below.

Comment IG-1-2

The WRIA 9 Watershed Ecosystem Forum acknowledges the critical importance of flood risk protection within the Lower Green River valley and appreciates the District's evaluation of the potential tradeoffs and differential impacts among alternatives in the draft PEIS. The proposed framework of Alternative 3 is the only alternative that embodies the District's commitment to deliver multi-benefit projects throughout the Corridor. In addition to making needed flood facility upgrades, this framework would also support meaningful contributions to salmon recovery, an opportunity to re-envision land use in the Corridor to enhance economic development opportunities, and diverse recreational opportunities along the river corridor. Although Alternative 3 represents a significant financial investment, the total estimated cost represents less than 0.3 percent of projected taxable revenue to be collected across the Corridor over the next 50 years.

Response to IG-1-2

Thank you for your observations regarding Alternative 3. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process. This process will incorporate information from the PEIS, including comments and findings. The Board will also accept comments as part of its deliberation.

Comment IG-1-3

The Lower Green River Corridor Plan should provide a model of what is possible with multibenefit floodplain management in an urban setting. We urge the District to work collaboratively with local officials to capitalize on this opportunity to ensure flood risk reduction investments support robust economic development and revitalization of adjacent communities. Multibenefit floodplain management has proven beneficial and cost-effective in other urban rivers. For example, multibenefit flood risk reduction efforts on the South Platte River have supported $10 billion in economic development in the City of Denver. Denver recently doubled down on multibenefit planning on the South Platte River, entering a new $550-million partnership with the U.S. Army Corps to revitalize a 6.5-mile reach of the South Platte River by reducing flood risk in underserved communities, restoring aquatic habitats, and creating new green spaces and recreational amenities – including improvements to the South Platte River Trail.

Response to IG-1-3

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat. The intent of all three alternatives under consideration is to prioritize multibenefit projects. Regardless of the alternative selected, the District has and will continue to closely coordinate with local jurisdictions.

Comment IG-1-4

The Spatial Rendering of Alternatives (Vol. 2, Appendix A, Attachment A) provides a useful starting point for differentiating between alternatives. Based on the high-level analysis in the PEIS (Table 4-5) the enhanced systematic multibenefit approach is the only way to make significant progress towards salmon recovery goals in the Lower Green. Although the Corridor Plan would represent a 50-year planning horizon, the analysis of salmon habitat goals in the PEIS only evaluates the alternatives in relation to shorter 10–20-year planning targets. Alternatives 1 and 2 would leave the watershed significantly short of the 10–20-year goals after 50 years of implementation. As a result, Alternative 3 represents the only alternative that makes reasonable strides towards established science-based recovery goals.

Response to IG-1-4

Please refer to the response to comment IG-1-2.

Comment IG-1-5

Achieving significant progress towards salmon habitat goals in the Lower Green River is essential to realizing the full potential of transformational ecosystem recovery investments being programmed across the watershed. The Federal government is projected to spend approximately $1 billion dollars ($220 million already secured) in restoring fish passage above Howard Hanson Dam. This will provide access to more than 100 miles of additional salmon habitat. The cleanup plans for the Lower Duwamish and East Waterway represent another approximately $600 million in investments. These two regionally significant investments will address two critical limiting factors to advancing recovery of the Green River Chinook population. Salmon benefiting from these watershed improvements will still need to successfully traverse the Lower Green River valley both as juveniles rearing and migrating to the ocean and as adults to spawn in the middle and upper watershed. It is essential that future efforts to enhance flood protection for the Lower Green River valley complement – not undermine – these other transformational regional investments.

Response to IG-1-5

The District would continue to coordinate with WRIA 9's ongoing ecosystem recovery efforts under all alternatives. The cumulative impact analysis in PEIS Appendix F includes downstream fish passage at Howard Hanson Dam, WRIA 9 projects, and Total Maximum Daily Load requirement.

Comment IG-1-6

Although we encourage the District to select the framework proposed under Alternative 3 as the preferred alternative, our membership does not endorse the specific facility alignment proposed in any of the spatial renderings. The spatial renderings are useful to support high level comparison and analytics, but they are not appropriate for evaluating site-specific impacts. The final project level alignment of future facilities requires more specific analysis of site-specific opportunities and a thorough discussion of tradeoffs between interest groups. The forthcoming Corridor Plan must be closely coordinated with local land use plans and the King County Flood Plan Update. It should also reflect the results of the anticipated District-funded visioning effort that will bring together the Lower Green Corridor city mayors and the County Executive's Office. We look forward to working with the District on the next phase of the corridor planning effort to achieve our collective goal of a thriving, prosperous, inclusive, and ecologically resilient Lower Green River Corridor.

Response to IG-1-6

Please refer to the responses to comments IG-1-2 and IG-1-3. The facility alignments shown in the referenced graphics are intended to be illustrative and are not actual proposals. Future projects proposed by the District would undergo project-specific environmental review and permitting.

Comment IG-1-7

Floodplain Habitats: Recent science has highlighted that freshwater rearing habitat is the primary limiting factor for increasing productivity of Green River Chinook salmon. Fish that migrate out to the Duwamish immediately (fry) are not surviving to return as adults. Fish that can find suitable rearing habitat within the river and grow larger (parr) before entering saltwater make up 95+ percent of returning adults. Research shows that juveniles are using recently restored rearing habitat (e.g., Downey Farmstead and Lower Russell Road) and residing in the Lower Green for extended periods. Expanding the availability of this habitat by reconnecting floodplains to the Lower Green River is critical to expanding the carrying capacity of the system to produce additional parr that experience higher levels of marine survival.

Response to IG-1-7

The PEIS examines alternative approaches to integrated flood hazard management, and PEIS Appendix B Section 5 compares how the alternatives may contribute to habitat and salmon recovery.

Comment IG-1-8

Instream Temperature: The Green River Temperature Total Maximum Daily Load (Ecology, 2011) projects that the shade deficit along the levee system in the Lower Green River will continue to drive lethal temperatures even as revegetation efforts expand across other areas of the watershed. Since the TMDL was developed, climate modeling efforts have predicted more dramatic increases in ambient temperatures which further emphasizes the importance of increasing tree canopy coverage along the riparian corridor. Only the framework established for Alternative 3 would support meaningful implementation of the TMDL within the Lower Green River Corridor.

Response to IG-1-8

Thank you for your comment. Shading and the TMDL are addressed in PEIS Appendix B Section 4 and PEIS Appendix F.

Comment IG-1-9

Land Use Impacts: Although Alternative 3 provides significantly more benefits to salmon, we acknowledge the need for tradeoffs between multiple interest groups within the watershed. Impacts to and potential loss of industrial, commercial, and residential lands cannot be taken lightly. The Corridor Plan is a 50-year plan, and it must be developed and implemented in concert with local land use planning. If done collaboratively, we believe there is an opportunity to ensure a gradual transition or relocation – as opposed to loss – of impacted land uses (e.g., housing and businesses). This will create a stronger and more resilient Lower Green River Valley that continues to serve as an economic powerhouse for the region/state. The projected differential impacts among alternatives – although significant – must be viewed in relation to the benefits provided by providing 500-year flood protection to the larger Lower Green River Valley. Under existing conditions, a 500-year flood would be devastating. It would flood 5,700-8,500 acres of land, displace 27,800-41,700 residents, and impact 28,200-42,200 jobs. All three alternatives significantly reduce these potential flooding impacts by nearly 50 percent or more. Although Alternative 3 would impact between 4,440 and 8,200 more jobs than Alternatives 1 and 2, plan implementation would occur over a 50-year timespan allowing for transition/relocation of those jobs to safer/more appropriate areas within the valley.

Response to IG-1-9

Thank you for reviewing the flooding results communicated in the PEIS and your observations regarding Alternative 3.

Comment IG-1-10

All three alternatives are projected to result in increased peak flows and overbank flooding downstream of river mile 11 (Duwamish River). All impacts to historically marginalized communities within the Duwamish River Valley must be mitigated.

Response to IG-1-10

Thank you for raising this concern about historically marginalized communities. The draft PEIS discloses potential changes in surface water elevation downstream of river mile 11 but does not discuss the extent of flooding or implications on downstream land uses. The final PEIS explains the results in Appendix B and other locations, where appropriate. The final PEIS Section 5.2 adds explanation of the role of hydraulic modeling during project implementation to ensure flood risk is not transferred upstream or downstream.

Comment IG-1-11

Economics: When looked at holistically and across a 50-year planning horizon, the differential impacts of pursuing Alternative 3 over Alternatives 1 and 2 are significantly overshadowed by the scale of benefits provided by an improved network of flood control facilities. Alternative 3 would impact an additional 90 to 140 acres of land over Alternatives 1 and 2 due to new, improved, and relocated facilities. This represents an impact of less than 1 percent of the historical floodplain and 2 percent of the existing area of industrial and commercial land uses within the Corridor. The projected impacts to $23M- $34.8M of commercial and industrial improvements – while again clearly significant – represent less than 1 percent of the total estimated assessed value of improvements within the Lower Green River Corridor. The total differential cost for implementation of Alternative 3 is somewhere between $190M and $730M above Alternative 1 (less for Alternative 2). Although clearly a significant cost, it represents between 2 and 9 percent of the $8 billion in annual taxable revenue generated within the Lower Green River Corridor. Considering the 50-year planning horizon, it represents less than 0.2 percent of projected taxable revenue to be collected across the Corridor over the next 50 years. That is a very reasonable investment to increase the resiliency of the Lower Green River Valley to elevated flooding concerns that come with projected shifts in our regional climate.

Response to IG-1-11

Please refer to the response to comment IG-1-2.

Comment IG-1-12

Spatial Renderings: Despite the utility of the spatial renderings for large-scale analytical and comparison purposes, they should not be used to access site-specific impacts or project feasibility associated with the different alternatives. For example, the Wrecking Yards (LG-6, 2021 Salmon Plan Update) would only appear viable under the Alternative 3 spatial rendering, which includes a levee setback in this location. This project should be explored for feasibility regardless of preferred alternative. These types of project-specific details require more in-depth stakeholder discussions of potential tradeoffs and should be left to future planning efforts associated with the development/implementation of a Corridor Plan.

Response to IG-1-12

Please see the response to comment IG-1-6. As noted in your comment, the spatial renderings are intended to inform programmatic comparison of the alternatives--not site-specific impacts or project feasibility. Site-specific analysis would occur during project planning and implementation.

Comment IG-1-13

Agriculture: The differential treatment of agricultural lands between the alternatives is confusing and potentially problematic. The inclusion of extensive new facilities within Agricultural Protection District (APD) under Alternative 3 is counterintuitive – especially when the majority are Type 1 facilities with no setback. This does not seem integral to the intent/framework of Alternative 3 and could result in misguided support/opposition, especially since this element could just as easily be associated with Alternatives 1 and 2. Further, given the location of mapped severe channel migration zones, significant portions of proposed levees appear to conflict with existing King County Code (21A24.045).

Response to IG-1-13

PEIS Appendix A Section 4.2.3 describes Alternative 3 as enhanced systematic implementation of multibenefits, one of which is viable and productive agriculture. The final PEIS expands on this idea where Alternative 3 is described in the Summary and in Chapter 3.

PEIS Appendix C Section 3 describes channel migration zone regulations. However, compliance with these regulatory requirements would be addressed during project-specific design and permitting. The Summary, Chapter 3, and Chapter 4 of the final PEIS add explanation of the complex regulatory requirements that must be met for this approach to protecting agricultural lands from flooding to be successfully permitted.

Comment IG-1-14

The inclusion of new flood protection facilities designed to provide flood protection up to 11,900 cubic feet per second (just below a 100-year flood event) along the APD could unintentionally create "fish traps" after flood events that overtop the facilities. Juvenile salmon that enter the agricultural lands to escape high flows during these events would likely become trapped behind the levees as waters recede, resulting in significant take of ESA listed Chinook salmon. The draft PEIS doesn't appear to account for this potentially significant impact.

Response to IG-1-14

The potential for outcomes like fish stranding would be addressed during project-specific design, modeling, and permitting. As noted previously, the Summary, Chapter 3, and Chapter 4 of the final PEIS add explanation of the complex regulatory requirements that must be met for this approach to protecting agricultural lands from flooding to be successfully permitted.

Comment IG-1-15

It is unclear why Alternative 3 would result in more flooding of farmland from River Miles (RM) 21.5 to 27.5 at 18,800 cubic feet per second. Alternative 3 appears to involve fewer Type 1 and Type 2 facilities and more levee setbacks that would provide increased flood storage. The additional flood storage capacity associated with Alternative 3 would seem to support reduced flooding risk of agricultural lands under Alternative 3. The final PEIS should provide enhanced clarity around the rationale behind differential flooding of agricultural lands in this reach among the three alternatives.

Response to IG-1-15

The PEIS describes the hydraulic modeling as based on planning level application of the alternatives and the general conditions found in the Corridor. At this generalized level, upstream of the main agricultural areas Alternative 3 has slightly lower water levels than the other alternatives during the 18,800 cfs flood event. Downstream of the agricultural areas Alternative 3 has slightly higher water levels than the other alternatives during the 18,800 cfs flood event. These differences are small and point to considerations that would be important to address in further planning and/or project-specific design. As projects are implemented over the 30- to 50-year planning period, project-specific modeling and design will be required to ensure that flood risk is not transferred.

Comment IG-1-16

Future Considerations: Following selection of a preferred alternative, we encourage the District to consider a reach-by-reach framework in the Corridor Plan. A framework for pursuing acquisitions and discussing tradeoffs at a larger reach scale may help alleviate the frequent frustrations felt by all interests in the current project-by-project approach. Tradeoffs may be more palatable at a larger scale and even result in larger and more significant benefits than at the single project scale. A reach-by-reach framework could also define a proactive long-term approach to voluntary acquisitions that would minimize/avoid the potential need for condemnation. The future Corridor Plan should outline a collaborative process to ensure development of the adaptive management process – and incorporated goals and indicators – is based on broad stakeholder input. Salmon habitat goals and indicators should reflect those adopted in the WRIA 9 2021 Salmon Habitat Plan Update. The Plan should outline a collaborative process for monitoring and reporting progress towards goals and highlight what steps the District will take if established goals are not being achieved.

Response to IG-1-16

Thank you for your comments. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process. This process will incorporate information from the PEIS, including comments and findings. The Board will also accept comments as part of its deliberation.

J-1: City of Kent

Comment J-1-1

Dear Ms. Clark: Thank you for the opportunity to review and comment on the Draft Programmatic Environmental Impact Statement (DPEIS) for the Lower Green River Corridor Flood Hazard Management Plan prepared by the King County Flood Control District (District). This letter includes the City of Kent's comments on the DPEIS with technical comments attached. The Lower Green River flows through the City of Kent for approximately twelve miles and is an integral part of its character and quality of life. The Green River Valley provides homes for tens of thousands of people as well as being the second largest industrial district on the west coast. It is also one of the main watershed habitats for several Puget Sound endangered salmon species. Its health and management in this increasingly urban environment is critical not only to the people, businesses and environment that are in the valley, but to the region at large, Consequently, a plan for how to manage and improve the river into the future from a flood risk reduction perspective incorporating the other multiple benefits associated with the river corridor will provide a guide for its success. The Lower Green River is a critical link between the Upper and Middle River Watersheds, and the Duwamish River and Puget Sound. It must be able to consistently convey all flows sent from the upstream watersheds in a manner that doesn't damage the flood protection, adjacent recreational facilities or the fragile riparian resources. The DPEIS includes a comprehensive analysis of many aspects of the Lower Green River Valley and provides insight into its importance to the region and the challenges it faces. The City has reviewed the DPEIS and is submitting questions and comments on aspects of the analysis that the city feels must be clarified or analyzed further in the Final Programmatic Environmental Impact Statement.

Response to J-1-1

Thank you for your comments.

Comment J-1-2

Following the EIS process, the City strongly believes it is imperative the District prepare a Flood Hazard Management Plan. Many aspects of how the river corridor is managed, such as for flood protection, heavily overlap with other priorities of the river and the valley at large. Integrating the various priorities which overlap with the river corridor through a plan is vital to the success of all the priorities. We agree with having the goals of each of the alternatives related to flood protection be virtually equivalent and with using a 500-year flood event on the Lower Green River as the flood protection goal for flood protection facility improvements. The region will be sorely challenged to be able to meet its goals for the benefits studied in the DPEIS without incorporating those elements in a meaningful way into the alternative incorporated into the Plan. Consequently, the City encourages the District to select the framework proposed under Alternative 3 as the preferred alternative, but does not endorse any specific facility alignment proposed. Attached please find the City's technical questions and comments on the DPEIS. Please do not hesitate to contact me or Michael Mactutis, P.E., Environmental Engineering Manager, with any questions.

Response to J-1-2

Thank you for your thoughts on the importance of the plan and support for the framework proposed under Alternative 3. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

Comment J-1-3

1. In the Summary, page S-2, the odds of a 100-year event occurring over a 30 year time span, should be corrected to 26 percent. The odds should be calculated with the same method as the odds of the 500-year flood event, discussed in the bullet point below that.

Response to J-1-3

This correction has been made in the final PEIS on page S-2 and elsewhere as applicable.

Comment J-1-4

2. Table S-3, Summary of Potential Direct Impacts, dismisses sea level rise due to upstream flows being controlled by the Howard Hanson Dam and navigational dredging protecting the study area from tidal inundation. However, the USGS gage on the Green River at S. 200th St. is already illustrating the influence of tidal levels up to and above 2,000 cfs of flow as shown in the chart below. [SEE PDF FOR IMAGE] In addition, the latest studies from the UW Climate Impacts group (screen shot below) estimate a rise in the relative sea level of 1.2 to 1.4 feet for the Duwamish River by the year 2070, just downstream from the Lower Green River. This sea level rise would decrease the flow capacity of the river in the lower reaches of the lower Green River and push the tidal influence miles further upstream. Were the data from the Green River at 200th St. at Kent, WA USGS gage and study by the UW Climate Impacts Group as shown in the link below included in the alternatives analysis? If not, due to the current tidal impact in the Lower Green, and the projected increase in sea levels, a further study of the impacts of future sea level rise must be incorporated into the flood modeling and alternative analysis. Given this additional information, how will sea level rise be incorporated into the Final PEIS?

	High (RCP 8.5)			Low (RCP 4.5)		
Year	1%	50%	99%	1%	50%	99%
2020	0.5	0.3	0.0	0.5	0.3	0.0
2030	0.7	0.4	0.1	0.7	0.4	0.1
2040	1.1	0.6	0.2	1.1	0.6	0.2
2050	1.6	0.8	0.3	1.5	0.8	0.2
2060	2.1	1.1	0.4	1.9	1.0	0.3
2070	2.7	1.4	0.5	2.5	1.2	0.4
2080	3.4	1.7	0.6	3.1	1.5	0.4
2090	4.2	2.0	0.7	3.7	1.7	0.4

https://cig.uw.edu/projects/interactive-sea-level-rise-data-visualizations/

Response to J-1-4

PEIS Appendix B Section 2 discusses climate change, including the findings of the UW Climate Impacts Group study and the implications and uncertainty for the Lower Green. An element common to all three alternatives is to continuously study the effects of climate change and use best available science for flood hazard management planning, adaptive management, and facility design.

Incorporation of sea level rise in hydraulic modeling is not necessary for a programmatic level of review. The purpose of the PEIS is to compare three alternative approaches for flood hazard management in the Lower Green River Corridor. Sea level rise is not seen as a differentiator among the alternatives because it would impact them all in a similar way. However, it should be considered as projects are implemented over the 30- to 50-year plan. The final PEIS Section 4.2 adds an explanation of the role of hydraulic modeling during project implementation. This same information is summarized in the final PEIS Summary Section S.12. Additional explanation of how the District would consider best available science is provided in the final PEIS Section 6.5.

Comment J-1-5

3. Section 1.4, A Place to Build, Buy, and Live, does not include reference the federal Duwamish/Green River Ecosystem Restoration Program which provided for partnerships between the federal and local governments on projects in the Lower and Middle Green River Watersheds, or the work by local agencies through the Water Resource Inventory Area 9 Watershed Ecosystem Forum. Were the completed projects coordinated or led by those programs and agencies incorporated in the analysis for this DPEIS? If so, how were these incorporated into the DPEIS?

Response to J-1-5

The referenced plan, developed prior to 2000, identified 45 projects in the Duwamish and Green Rivers. These projects have been incorporated in the PEIS. Some of the projects have already been constructed and are included in the project baseline and reflected in the hydraulic modeling. Those that have not been constructed appear to have been incorporated into the WRIA 9 Salmon Habitat Plan, which is included in the cumulative effects analysis in PEIS Appendix F.

Comment J-1-6

4. Section 2.1, What's at Risk, mentions flooding up to 40 feet deep in places, which is a large amount of flooding and worth investigation and discussion. Where are the locations for this potential depth of flooding?

Response to J-1-6

The final PEIS Section 2.1 corrects the maximum depth of flooding under existing conditions. The 40-foot depth is the approximate maximum depth in the channel near the mouth of the Duwamish River at 18,800 cfs. On the floodplain, the Johnson Creek area experiences the deepest flooding of up to approximately 19 feet during an 18,800 cfs event.

Comment J-1-7

5. Section 4.3, Living and Working Around the River, discusses protecting agricultural areas from flooding up to 11,900 cfs. Since Mill Creek (Auburn) begins to reverse flow from the Lower Green at a much lower level, this is a significant change from the current condition. Protection of the agricultural areas up to 11,900 cfs will require more water to remain in the river, causing higher river water surface levels in the areas adjacent to the agriculture as well as for miles upstream and downstream, and for floodwater to spill over more quickly into the agricultural areas when flows reach 11,900 cfs, potentially causing more damage to homes and fields due to increases in flow rates and specifically velocities through those areas, increasing the risk for erosion and scour of the farmlands.

Response to J-1-7

PEIS Appendix B, Section 3.4.2, presents the modeling results for the 11,900 cfs flood event for each alternative and shows that the cumulative effects of District actions on flooding under Alternative 3 at an overview level are similar to Alternatives 1 and 2. However, it is important to note that these results reflect the accumulation of all of the management strategies applied to Alternative 3--not just agricultural protections to 11,900 cfs. The potential changes of protecting agricultural lands to 11,900 cfs would be subject to project-specific design, modeling and permitting. Also, note the 11,900 cfs agricultural protection area did not extend to the mouth of Mill Creek (Auburn), so changes at that particular location would be minimal. Each project must comply with applicable regulations, and the transfer of flood risk would not be permissible. The final PEIS has added explanation acknowledging the complex regulatory requirements in the Summary, Chapter 3, and Chapter 4.

Comment J-1-8

This increase in flood protection would require restrictions from flows in creeks which includes important rearing habitat for endangered salmon. The inclusion of new flood protection facilities designed to provide flood protection up to 11,900 cubic feet per second (just below a 100-year flood event) along the Agricultural Production Distrcit could unintentionally create “fish traps” after flood events that overtop the facilities. Juvenile salmon that enter the agricultural lands to escape high flows during these events would likely become trapped behind the levees as waters recede. The agricultural area between Kent and Auburn is largely classified as a floodway on FEMA’s current Flood Insurance Rate Maps, and local codes require restriction of any increases in elevations of flood water in floodways at the 100-year flood event. How has the DPEIS taken the issues of flood levels, endangered species impacts and flood mapping into account?

Response to J-1-8

The potential for outcomes like fish stranding and changes in upstream and downstream flooding is best addressed during project-specific design, modeling, and permitting. As noted previously, the Summary, Chapter 3, and Chapter 4 of the final PEIS add explanation of the complex regulatory requirements that must be met for this approach to protecting agricultural lands from flooding to be successfully permitted.

Comment J-1-9

6. Per Appendix A, Alternative Development and Description, Figure 4-9, there are several levee reaches which are not enrolled in the federal PL 84-99 Levee Rehabilitation Program despite protecting large areas of existing homes and businesses. Per Table 4-2, it doesn’t appear that any alternatives propose adding those unenrolled facilities to the Levee Rehabilitation Program. Some examples of unenrolled levees include the Milwaukee II Levee, Foster Park Levee, Naden Avenue Levee and the Frager Road Levee. Several of these facilities are bracketed by facilities that are enrolled in the Levee Rehabilitation Program. Has analysis of inclusion of those levees been considered by the District, and are there reasons to continue to exclude them from enrollment? If so, please clarify reasons for exclusion.

Response to J-1-9

The three alternative approaches to flood hazard management in the Lower Green River Corridor do not address when flood hazard management facilities should be added to the PL 84-99 program. As described in Section 2.2.1.1 of PEIS Appendix A, the benefit of enrollment in the program is federal participation in the cost of repairs if enrolled facilities are damaged during a flood event. Enrollment in this program is a separate process from flood risk management.

Comment J-1-10

7. In addition, the facilities not enrolled in the PL 84-99 program which protect areas of homes, businesses and critical vulnerable infrastructure should be improved at least to the 500-year flood level of protection, plus 3 feet of freeboard to provide consistent flood protection to areas with significant development and infrastructure. To exclude unenrolled facilities from proposed improvement to that level of protection would provide lesser protective links in the chain of levees through the Lower Green. The exclusion of those facilities from improvement to meet the 500-year flood level would result in areas of increased vulnerability to flooding.

Response to J-1-10

Each of the alternatives provides a hierarchy to guide District actions regarding non-PL 84-99 facilities. While not the first choice under Alternatives 2 and 3, improving these facilities to the 18,800-cfs level of protection is not excluded. Depending on the site-specific circumstances, improvement of the levees could be the District's direction.

Comment J-1-11

Specifically, all alternatives shown in Figure 4-1, Inundation for 18,800 cfs event show significant flooding of the Johnson Creek watershed, which includes the Kentview/Riverview neighborhood areas (several hundred residences in the lower areas near the river), S.212th St/Orillia Road, which is a main link between the Green River Valley and I-5 and the West Hill, as well as the last remaining agricultural areas in NW Kent. Have the impacts to the flooding in this area been specifically considered in the alternative analysis, and if there are reasons the homes and infrastructure in this area would be excluded from flood protection improvements, please describe these reasons?

Response to J-1-11

The impacts of inundation in this area have been evaluated at a programmatic level with results described in PEIS Chapter 4 and Appendix C. These are conceptual results that help show the differences among the alternatives and are not based on site-specific planning or design. When the alternative approaches summarized in PEIS Chapter 3 and detailed in PEIS Appendix A are applied to such a situation (no existing levees or floodwalls), the preferred approach under Alternatives 2 and 3 is to consider acquisition or flood proofing first, especially given the amount of flood water that is stored in this vicinity during an 18,800 cfs event and the relatively low-intensity land uses. Please note that south of S 212th St, where residential densities increase, all three alternative approaches would construct flood hazard management facilities. Any backwatering from areas to the north would be addressed through flood proofing first.

Comment J-1-12

8. Frequently, the US Geological Service adjusts its water surface/flow rating tables at its gages as river conditions change to keep the gages accurate through changing conditions. This is especially important for the Green River because the U.S. Army Corps of Engineers uses the USGS Gage at Auburn to schedule its flow releases from the Howard Hanson Dam. The adjustments had been relatively minor over the life of the Howard Hanson Dam until 2020. The upper levels of the flow rating curve at the Auburn Gage were adjusted significantly upwards during the storm event in February, 2020. Consequently, while documented flow levels were higher in other historic storm events, the water surface elevations at the Auburn gage during the February, 2020, storm were the highest recorded since the Howard Hanson Dam was built. These higher water surface elevations carried through the Lower Green River during that storm event. Listed below are several historic floods including water surface elevations and rated flows at the Auburn gage.

Year	Green River at Auburn Water Surface Elevation	Rated Flood Flow
1965	63.20	11,400 cfs
1975	63.41	12,100 cfs
1996	63.62	12,400 cfs
2020	64.26	11,700 cfs

Because the releases from the Howard Hanson Dam are based on rated flows rather than water surface elevations, a change in river conditions resulting in a change in the rating curve, such as the 2020 flood event, can increase the likelihood of a levee breach or failure in the Lower Green River. Flood protection facilities, recreation facilities, and natural resources, which are all functional based on water surface elevations, are not able to be easily adjusted to increases in rated water surface elevations. How will future changes in river conditions or the USGS gage rating curve be integrated in the alternatives? What is proposed to maintain the flood risk reduction levels in the Lower Green River valley through dynamic river conditions?

Response to J-1-12

Changes in the rating curve are not a differentiator among the alternatives - all alternatives would be impacted similarly. The provisional level of protection, 18,800 cfs plus 3 feet of freeboard, provides a considerable buffer against future changes in the rating curve before facilities would be threatened. In general, dynamic river conditions can be addressed in the same way as sea level rise. Please refer to the response to comment J-1-4 above.

Comment J-1-13

There are numerous ways that flood protection facilities can have a negative impact on recreation, and it is important that the LGRCFHMP DPEIS take this into account. This DPEIS does a deep dive into how to incorporate other public benefits into flood protection projects and it needs to the do the same with recreation. Quality parks and trails along the Green River Corridor are extremely important to Kent residents, a statistically valid survey completed as part of the City's, "City of Kent Recreation Program Plan" showed that the biggest barriers to recreation for our lower income residents are a lack of time and a lack of transportation. The Green River is the recreational amenity for many of these residents and the parks and trails along it need to be preserved, enhanced, and given room to expand as demand continues to increase. In the City of Kent's 2022 Park and Open Space Plan a statistical valid and demographically representative survey of residents showed that respondents, "Top Priority Investments" included nature trails, paved walking and biking trails, natural areas/wildlife habitat, access to water (rivers & lakes) and regional trails & connections. This plan also includes plans for 19 projects along the Green River Corridor, all of which could impact future flood protection plans.

Response to J-1-13

Thank you for providing these comments about recreation. As described in Section S.3 of the draft PEIS Summary, the goals and purposes of the Plan are to provide an integrated and reasonable long-term approach to reduce flood risks within the corridor while balancing multiple objectives. These objectives are realized by supporting ten multibenefits, including recreation and other opportunities to connect people to nature. Please refer to the detailed responses that follow.

Comment J-1-14

There are numerous ways that flood protection facilities can have a negative impact on recreation, and it is important that this plan take this into account. Disconnecting People from Rivers – People love to recreate on, next to, or in sight of water. The Green River is the most important natural recreation amenity in the city. By necessity, levees and flood walls are barriers that divide people from the river. Physical barriers - Flood protection facilities create physical barriers between people and the river, to mitigate this, river access for people needs to be intentionally protected and created as part of flood control projects. Flood protection facilities are also being pushed further and further from the river, it isn't enough to just keep trail facilities on top of levees that can be moved 100's of feet away from rivers, people need to be close to rivers when possible, so recreational amenities need to regularly connect back to the river. Visual barriers – Walls and earthen levees create visual barriers between people and rivers, to mitigate this, access needs to be designed into flood protection projects to get people up and over flood protection barriers. Experiential barriers – It is important to revegetate riparian corridors, but this dense vegetation has unintended negative side effects. Dense vegetation blocks views of the river and creates hiding space for negative behaviors. These negative behaviors create public safety issues and lead to park and trail users feeling unsafe. It is necessary for people to feel safe to recreate, these spaces need to be designed and maintained to reduce negative behaviors. Experiential barriers – It is important to revegetate riparian corridors, but this dense vegetation has unintended negative side effects. Dense vegetation blocks views of the river and creates hiding space for negative behaviors. These negative behaviors create public safety issues and lead to park and trail users feeling unsafe. It is necessary for people to feel safe to recreate, these spaces need to be designed and maintained to reduce negative behaviors

Response to J-1-14

The concerns raised in this comment are addressed in a variety of sections of the PEIS. The regulatory requirements for and importance of shoreline access, views of the river, and parks and recreation facilities are acknowledged in Appendix C, Section 3.1.3 (shoreline master programs), Section 3.1.5 (aesthetics), Section 3.4.2 (health and the environment), and Section 3.7.4 (parks and recreation facilities). The impacts that could result from the three alternatives are summarized in Appendix C, Sections 4.1.1 (land use plans and policies) and Section 4.1.7 (public services), and detailed in Appendix C, Section 4.2.1 (land use plans and policies) and Section 4.2.7 (public services).

Comment J-1-15

Maintenance – Recent trends in flood protection take more natural approaches to projects and are often touted as not requiring maintenance. While taking more natural approaches to flood protection is the right thing to do, dense vegetation in urban areas requires maintenance. It is not enough to just fund the construction of these projects; maintenance also must be funded, or flood control projects will continue to negatively impact urban areas. It isn't enough to just provide the public with flood control benefits if at the same time their parks and trails are made less safe, less inviting and lead to other negative outcomes.

Response to J-1-15

Thank you for your comment. Maintenance is managed on a County-wide basis, rather than as part of an area-specific plan.

Comment J-1-16

Leaving opportunities to address future needs – Populations in urban areas of Kent are projected to continue to grow, this means the demand for parks, trails and opportunities for recreation will continue to grow as well. Too often trails and park spaces along these flood protection projects are designed to minimum standards and reduce the amount of usable park space. Parkland to maintain Kent's current park level of service and additional space to meet future demand needs to be preserved.

Response to J-1-16

PEIS Section 5.1.7, describes how recreation and other opportunities to connect people with nature could be realized through flood hazard management. This includes not just preservation of existing facilities but opportunities for the creation of new facilities in collaboration with local jurisdictions. Table S-7 compares these opportunities among the three alternatives.

Comment J-1-17

Climate Change – As our climate continues to warm, the need for recreational access to water will increase. Access to water needs to be designed into these projects to give people opportunities to cool off as temperatures rise. Water Recreation – Easily accessible beaches on the Green River, like any body of water, are extremely popular spots for people to cool off. If the Green River in Kent had more locations where residents could access the water easily, they would be heavily used for people to cool off. As our climate continues to warm, the need for recreational access to water will increase. Access to water needs to be designed into these projects to give people opportunities to cool off as temperatures rise. Access to water to cool off will be most beneficial to those who can't afford air conditioning, or other costly or time-consuming ways to beat the heat. Tubing and Kayaking would also be much more popular if there were more locations to launch hand carry boats along the Green River. Flood protection facilities prevent access unless it is specifically designed to allow it.

Response to J-1-17

Access to the Green River can be visual or physical and includes access for fishing, swimming, and boating. Access to the shoreline is generally addressed in the land use plans and policies sections of PEIS Appendix C Sections 3.1 and 4.1. Opportunities for access are also described in PEIS Chapter 5, when discussing recreation and other opportunities to connect people with nature.

Comment J-1-18

The DPEIS does a deep dive into how to incorporate habitat improvements into flood protection projects and it needs to the do the same with recreation. This requires incorporating landscape architects and park professionals into the project team to propose conceptual designs to mitigate for the above impacts. These conceptual designs should show: How to get people up and over the levee to the river. How to get people down to the river in a safe and inviting way using Denver's confluence park as inspiration. How to create quality view corridors, viewing platforms and overlooks to mitigate impacts of increased vegetation and moving trails further from the river. Projects that will impact specific parks and trails must be designed with landscape architects and park professionals on the project team to ensure that unintended negative impacts are avoided and opportunities for achieving multiple benefits aren't missed.

Response to J-1-18

PEIS Appendix A generally describes opportunities for incorporating recreation into flood hazard management facilities. Specifically, Section 4.2 provides illustrative exhibits that show how trails could be incorporated into facility design. The description of Type C facilities also notes that there is more opportunity to incorporate other recreational elements such as viewing platforms, view corridors, boardwalk trails, access points to the river, and passive recreation opportunities. The details of these recreational elements would be addressed during project-specific design.

Comment J-1-19

Page 1-21 – The two most prominent parks on the Green River in Kent are Hogan Park, Van Doren's Landing Park and Riverview Park. Riverfront Park does not exist.

Response to J-1-19

Riverfront Park has been removedfrom the final PEIS Appendix C.

Comment J-1-20

Page 3-12 – 3-16 – These typical levee footprints need to incorporate regular access for people to trails and the river. These footprints are minimums, actual footprints should vary in width at the top to allow for viewpoints, maintenance access, staging, etc.

Response to J-1-20

As noted in the comment, actual dimensions could vary, depending on project-specific design. These typical sections are provided for illustrative purposes. This information has been added in the final PEIS where the typical sections are provided (both in the main body and in appendices).

Comment J-1-21

Page 3-15 – Figure 3.7 does not create a safe and usable trail condition and should not be used for long stretches in areas adjacent to populated areas.

Response to J-1-21

Trail design considerations would be addressed during project-specific implementation when design elements could be considered to mitigate the concerns expressed in the comment. Please also refer to the response to comment J-1-20.

Comment J-1-22

Page 4-8 – Removing recreational facilities without replacing them is not likely to be an acceptable impact in Kent. Any negative impact to qualitative or quantitative recreation opportunities along the Green River in Kent need to be mitigated for.

Response to J-1-22

This comment pertains to a list of examples of how flood hazard management facilities could directly impact adjacent land uses. In the final PEIS, the text in this section has been revised to say "relocating recreational facilities."

Comment J-1-23

Page 4-10 – This section discusses impacts to view corridors, this isn't really discussed in the sections of the plan that evaluate cumulative impacts and it needs to be.

Response to J-1-23

Cumulative impacts are an aggregation of many factors, and as a result are evaluated at a broader scale and more generalized level than direct impacts. Because view corridors are affected by overall development and not just flood management facilities, PEIS Appendix F includes view corridors as part of the cumulative impact analysis of land use.

Comment J-1-24

Page 4-11 – "Replacement lands could be required for impacts on certain types of land uses such as park lands. For example, if facility development were to result in the loss of park lands acquired with federal or state funds, then compensation for those losses would be required." This fails to include replacement of land, trails or parks funded locally, the Green River is a key recreational corridor in the City of Kent, that the City of Kent has invested millions of dollars acquiring parkland and developing trails and parks in the Lower Green River Corridor. The parks and trails in the Lower Green River Corridor in Kent generate millions of visits a year.

Response to J-1-24

The final PEIS revises this discussion to add that, in general, additional mitigation will likely be required for impacts to park lands, trails, and open space based on project-specific environmental review. Similar changes have been made to applicable sections of final PEIS Appendix C.

Comment J-1-25

Page 4-23 – "If building, improving, or relocating levees would result in the loss of parklands that have been acquired with federal or state funds, then compensation for those losses would be required – for examples, by acquiring and making available suitable replacement lands." Again, parks built with local funding should also be replaced.

Response to J-1-25

Please refer to the response to comment J-1-24.

Comment J-1-26

Page 4-23 – This section needs to talk about the Green River as a recreational amenity for those that live in the Lower Green River Corridor. It doesn't mention water recreation at all, or the unintended negative impacts that building levees and flood walls can have on access to parks, trails, and the river itself.

Response to J-1-26

Water recreation is included in PEIS Chapter 1 and Appendix C. Impacts are provided in Appendix C. In the final PEIS, as recommended, more information is pulled from Appendix C and provided in Chapter 4 and also included in the Summary.

Comment J-1-27

Page 4-31 – Without fully understanding everything that goes into the "lower opportunity areas" generally these types of broad, regional metrics fail to accurately capture park, trail and recreational value and access. These generally fail to gauge the quality or access of park and recreational spaces. While appreciating the necessity of levees and floodwalls in reducing flooding of urban areas, they also create walls between rivers and people. These walls need to provide regular, safe, and inviting access no less than every 500 feet in urban areas. Levees can be every bit as big a barrier as a highway or railroad if they aren't designed to ensure that people will choose to access park and trail facilities on the other side of the barrier. These unintended consequences of single benefit design can have significant social equity and environmental justice impacts.

Response to J-1-27

The PEIS examines potential impacts to parks, recreation, and open space in the context of local jurisdiction plans and regulations, as well as through the lens of equity and social justice. The section of the PEIS referenced in this comment is focused on the latter. A more detailed analysis of the impacts is provided earlier in the chapter. In addition, Appendix C, Section 3.7 describes the importance of parkland to the City of Kent, as described in the City's Parks and Open Space Plan. Please refer to the previous response that addresses flood hazard management facilities as barriers to accessing the river.

Comment J-1-28

Similarly, habitat areas and open space that do not invite positive public uses suffer from a lack of positive natural surveillance and attract negative activities in urban areas. A combination of good design, that makes people want to visit these spaces, and a constant maintenance presence are the only way to prevent open space in urban areas from becoming a significant safety threat that will impact adjacent residential, commercial, and industrial development and prevent people from using adjacent parks and trails.

Response to J-1-28

As noted in this comment, opportunities for incorporating public safety considerations into flood protection facilities are best addressed during project-specific design.

Comment J-1-29

Page 5-5 - "Improve public access (physical and visual) to parks and open space where the need for access is the greatest. The opportunity index developed by the Puget Sound Regional Council provides a tool for understanding the need." The Green River is an important recreational amenity in the City of Kent, setback flood facilities and steep banks prevent people from accessing the Green River. Quality public access to the Green River itself needs to be incorporated into district projects.

Response to J-1-29

The referenced section is specific to equity and social justice. Please refer to the response to J-1-17 for additional information about access to the river.

Comment J-1-30

Page 5-5 - Dense vegetation in urban areas that does not incorporate positive public use and is not regularly maintained regularly creates safety concerns, and makes people feel unsafe in adjacent parks and trails.

Response to J-1-30

Please refer to the response to comment J-1-28.

Comment J-1-31

Page 5-9 - The district must work with local jurisdictions to fill in gaps in recreation, preserve existing recreational opportunities and allow for the future growth of recreation along the Green River Corridor. Where flood facilities create barriers between people and the river, quality access needs to be incorporated at regular intervals. Where flood facilities or habitat improvements push people away from the river, quality opportunities to recreate near, next to and in the river must be provided. Where flood facilities or habitat improvements are built, they need to be maintained to ensure that they do not negatively impact adjacent land uses.

Response to J-1-31

As noted in this section of the PEIS, the multibenefit of recreation and other opportunities to connect people to nature requires collaboration with the local jurisdictions. Please refer to the previous responses regarding access to the river.

Comment J-1-32

5-12 - Table 5-1: Improved public access to parks, open space, and the Green River. Flood control facilities and habitat projects that are not maintained will negatively impact everyone who lives, works, or plays next to them.

Response to J-1-32

Please refer to the response to comment J-1-15 regarding maintenance. Please refer to the response to comment J-1-26 regarding water recreation.

Comment J-1-33

5-13 – Table 5-2: Dense vegetation adjacent to residential, commercial, or industrial development and parks and trails needs to be regularly maintained to ensure it doesn't negatively impact adjacent uses. Water recreation is extremely popular, residents near the Green River should have safe access to recreate in the Green River. Locations along the Green River where people can easily access the Green River are extremely popular for water recreation when the weather gets hot.

Response to J-1-33

Please refer to the previous response to comment J-1-15 regarding maintenance.

Comment J-1-34

5-16 – Table 5-7: Design can't just "allow" for public access, it must be designed, built, and maintained in a manner that will be safe and inviting while creating a positive recreational experience. All three alternatives need to ensure that flood protection facilities do not create a barrier between people and the river.

Response to J-1-34

Please refer to the responses to previous comments. The PEIS evaluates programmatic approaches to flood hazard management, and Table 5-7 examines at a programmatic level how recreation and other opportunities to connect people to nature could be realized for each alternative.

Comment J-1-35

List of Preparers: The project team would benefit greatly from including landscape architects that are experienced in river park and trail design in urban areas.

Response to J-1-35

The PEIS evaluates programmatic approaches to flood hazard management. Design expertise is appropriate during project-specific implementation and would be employed during that process.

Comment J-1-36

A-45 - A minimum 12-foot-wide access on the river is too small, it needs to be at least 16 feet.

Response to J-1-36

PEIS Appendix A Section 4.5 notes that the design guidelines presented in the PEIS are general descriptions intended to inform programmatic evaluation of impacts.

Comment J-1-37

A-49 - Figure 4-13 - is not an acceptable levee prism for more than very short stretches of riverbank in populated areas.

Response to J-1-37

As noted at the beginning of PEIS Appendix A Section 4.5, the design guidelines presented in the PEIS are general descriptions intended to inform programmatic evaluation of impacts.

Comment J-1-38

A-51 - Figure 4-15 – Vegetation along levees with benches is much denser than this. This figure is extremely misleading.

Response to J-1-38

As noted at the beginning of PEIS Appendix A Section 4.5, the design guidelines presented in the PEIS are general descriptions intended to inform programmatic evaluation of impacts.

Comment J-1-39

A-53 – Road base is not an acceptable trail surface. It creates trip hazards and is not a comfortable walking medium. It is also not a good surface for bikes if the trail can accommodate them. It needs to be 3/8's minus or ideally 1/4" minus to make the trail ADA accessible where grades allow.

Response to J-1-39

As noted at the beginning of PEIS Appendix A Section 4.5, the design guidelines presented in the PEIS are general descriptions intended to inform programmatic evaluation of impacts.

Comment J-1-40

A-55 4.5.5.10 - Miscellaneous Project Features – This list should include view corridors, access to the river, hand-carry boat launches and overlooks.

Response to J-1-40

As noted at the beginning of PEIS Appendix A Section 4.5, the design guidelines presented in the PEIS are general descriptions intended to inform programmatic evaluation of impacts.

Comment J-1-41

Page 65 – Relocation of Existing Facilities – This map appears to show a Type C facility near River Mile 20 potentially impacting Riverbend Golf Course, Russell Road Shops and Hogan Park. This location is not a potential location for a setback levee and should be removed from this plan.

Response to J-1-41

PEIS Appendix A Section 4.3 explains that the spatial renderings are intended to facilitate the evaluation of potential costs and impacts, based on estimates of how the policy-level approaches and guidelines for each alternative described in Appendix A Section 4.2.2 could be applied. No specific flood management projects have yet been identified. The policy-level approach for Alternative 3 contemplates setback levees in the vicinity of active recreation facilities that could be adapted to a smaller footprint to accommodate a setback.

Comment J-1-42

Page 65 – Relocation of Existing Facilities – This map appears to show a Type C facility near River Mile 20 potentially impacting Russell Woods Park. If this park is impacted it will need to be relocated, physical and visual recreational access to the Green River needs to be preserved and enhanced, and the Green River Trail will need to be rerouted and meet City of Kent regional trail standards.

Response to J-1-42

Please refer to the response to comment J-1-41 regarding the purpose of the spatial renderings. Please refer to the response to comment J-1-24 regarding mitigation for parks and recreation impacts.

Comment J-1-43

Page 66 – New Facilities – This map appears to show new facilities on the Frager Road side of the river starting at River Mile 18. Frager Road is a regional trail in Kent and will need to accommodate a wide trail section. The trail will need to maintain its connection to the river and there are plans to add additional recreational amenities along this stretch.

Response to J-1-43

Please refer to the response to comment J-1-42. In addition, PEIS Appendix C Section 4.1.7 notes that new and relocated facilities offer an opportunity for new and relocated trails, respectively.

Comment J-1-44

B-26 - Alternatives 2 and 3 flood a wide area that will include the route of the missing link of the Green River Trail connection between Kent and Auburn. This trail needs to be elevated above frequent flooding events.

Response to J-1-44

The policy-level approaches under Alternatives 2 and 3 prefer the use of flood proofing before building new flood hazard management facilities in many situations. The figures on the referenced page show one of those situations adjacent to agricultural lands. Elevating roads and trails could be an appropriate treatment in this situation.

Comment J-1-45

C-52 – Riverfront Park does not exist, this area is the Riverbend Golf Complex. The KOA campground no longer exists. There is one missing segment of the Green River Trail in Kent between the Union Pacific Railroad and the BNSF Railroad.

Response to J-1-45

The park name is corrected in Appendix C, as well as other applicable locations in the final PEIS. Please note that the PEIS presents conditions as of 2020 and notes those conditions may have changed between 2020 and publication. The final PEIS adds this clarification at the beginning of Appendix C Sections 2 and 3.

Comment J-1-46

C-123 – KCC 15.08.260 sidewalks and private trail systems are required to connect to riverside public trails or scenic drives at intervals of one thousand (1,000) feet or less in industrial developments, and intervals of five hundred (500) feet or less in residential developments. The levee system cannot block these connections.

Response to J-1-46

Thank you for your comment. Requirements such as these would be incorporated into Plan development and project-level design.

Comment J-1-47

C-124 – Riverfront Park does not exist, please correct golf course name to, “Riverbend Golf Complex”. There are also scattered views of the river from the Green River Trail along Signature Pointe, McCoy Levee, Breda Levee, Upper Russell Road Levee, Briscoe Levee, Boeing Rock Park, Horseshoe Bend Levee, among other locations.

Response to J-1-47

The final PEIS includes these corrections and additions.

Comment J-1-48

C-181 – Table 3-61 – The City of Kent maintains and operates 26.6 miles of trails in the Lower Green River Corridor. King County does not maintain any trails in the Kent City limits. 6.1 miles of the Interurban Trail are formally managed by King County through an agreement with Puget Sound Energy, however, City of Kent has been responsible for maintaining this trail since 1977. The Green River Trail in Kent is entirely owned and operated by the City of Kent.

Response to J-1-48

The data source for trail management is King County GIS. The final PEIS Table 3-61 adds a note about the source and the inability to distinguish between who manages and who maintains trail facilities, based on this data source.

Comment J-1-49

C-186 – Kent Parks now maintains and operates the publicly accessible portions of the Green River Natural Resource Area.

Response to J-1-49

The PEIS acknowledges that Kent manages the Green River Natural Resource Area.

Comment J-1-50

C-188 – 19 separate park projects (including trail projects) will potentially impact the Lower Green River Corridor Flood Hazard Management Plan. This does not include flood protection or habitat projects that could impact parks or trails in Kent outside of projects already identified in the City of Kent 2022 Park and Open Space.

Response to J-1-50

The final PEIS incorporates this information.

Comment J-1-51

Table 4-1 – Parks and Recreation – the measured impact seems to focus on inundation, but the built flood protection facilities and associated habitat work will negatively impact parks and trails if the impacts of levees and floodwalls separating people from the river and open space without positive public use and regular maintenance are not mitigated as part of the plan/projects.

Response to J-1-51

The PEIS includes an assessment of the direct impacts to parkland and trails that result from flood hazard management facilities (see Appendix C Table 4-3). Please refer to the previous responses with respect to evaluating access to the river.

J-2: City of Tukwila

Comment J-2-1

Dear Ms. Clark: Thank you for the opportunity to comment on the Lower Green River Corridor Flood Hazard Management Plan's (the "Plan") draft programmatic environmental impact statement (PEIS). The City of Tukwila supports the King County Flood Control District's (the "District") commitment to integrated flood risk reduction while balancing the multi-benefit goals of equity and social justice, environmental justice, habitat protection and salmon recovery, resilient communities and ecosystems, productive and viable agriculture, sustainable development, jobs and sustainable livelihoods, open space conservation, sustainable and clean water, and recreation and other opportunities to connect people to nature. As such, the City supports Alternative 3: Enhanced Multi-benefit Implementation as a preferred alternative. However, we have some concerns with Alternative 3 which we have outlined below. We have also attached additional comments of a more detailed nature.

Response to J-2-1

Thank you for your comments. Your support of Alternative 3 is noted. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process. This process will incorporate information from the PEIS, including comments and findings. The Board will also accept comments as part of its deliberation.

Comment J-2-2

First, because the planning level cost estimates for Alternative 3 are up to $1.1 billion, it will be important as specific projects are considered that their costs and benefits are compared to other potential projects to ensure we maximize the benefits within available funding.

Response to J-2-2

Thank you for your comment.

Comment J-2-3

Second, under Alternative 3 it is stated "To find more places that levees and floodways could be set back further from the river, the District would coordinate with the cities to identify areas where redevelopment might happen (page 3-9)." We support the District using its tools, including condemnation, to set back levees and floodwalls and appreciate the District's commitment to coordinate with the cities when considering areas where redevelopment might happen.

Response to J-2-3

Thank you for your comment.

Comment J-2-4

Third, under Alternative 3 it is stated where there are flood protection facilities that are not part of the federal PL 84-99 program, the District " .. . would leave the existing levee in place, but would otherwise do nothing, allowing the area to inundate". This may be a sound policy for most situations, but we encourage the District to include some flexibility because there may be instances where an exception makes sense. For example, the soccer fields at the Starfire Sports Campus have a low ratio of improved value to land value but they are synergistic with the rest of the complex that serves over 1.3 million participants and visitors annually and provides many benefits to the region. Given its size and unique use, it would be difficult to relocate the entire facility within the region.

Response to J-2-4

Please refer to the description of Alternative 3 in PEIS Chapter 3 Table 3-3. As shown in this table, the District's approach when there are existing non-PL 84-99 facilities is to apply a hierarchy. While the preferred approach under Alternative 3 is to consider acquisition first and then flood proofing, improvements to the existing facilities are not excluded. In the circumstances near the Starfire Complex, all three alternatives would in fact improve the existing faciliies. The inundation shown in this area on the maps in Chapter 4 would be addressed through project-specific modelng and design.

Comment J-2-5

Fourth, we ask that a flood protection project be prioritized near the City's Minkler Shop's property. The City is currently in the process of relocating this critical facility outside of the flood plain. Once the City has completed its relocation, the property is available for acquisition. Setting back the levee at the Minkler Shops location has been identified as a key project to help prevent future levee failures in the Southcenter District and is consistent with Alternative 3. The location also provides the opportunity for a multi-benefit project addressing flood protection, recreation, and salmon restoration.

Response to J-2-5

In circumstances such as those in the vicinity of the Minkler property, all three alternatives would improve the existing PL 84-99 levee. Under Alternatives 2 and 3, the planning-level approach would be to relocate the levee farther from the river, consistent with your comment.

Comment J-2-6

Fifth, we recognize the PEIS is focused on the 18,000 cfs scenario but there are risks even under that threshold and we encourage the District to consider risks at lower flows in the Plan.

Response to J-2-6

The purpose of the PEIS is to compare three alternative approaches for flood hazard management in the Lower Green River Corridor, based on the adopted provisional level of protection of 18,800 cfs.

Comment J-2-7

Finally, we encourage the District to consider forming a multi-jurisdictional, cross discipline advisory group to align shared interests around flood risk reduction with the other multi-benefit goals. Again, we appreciate the work the District is doing to reduce flood risk and achieve other multibeneficial goals in the Lower Green River Corridor. Please contact me at 206-433-1850 or David.Cline@TukwilaWA.aov if you have any questions.

Response to J-2-7

If the District proceeds with a Plan, both Alternatives 2 and 3 include the following: "The District would establish a process to periodically evaluate progress under the Plan based on established goals and indicators. The District would include Tribes, federal and state agencies, local jurisdictions, and stakeholders in the periodic review." Under Alternative 1 the District would continue flood hazard management, but without a Corridor-wide plan.

Comment J-2-8

1. The modelling used for the 18,800 cfs flood scenario for the no-build option (Appendix B, Figure 3-1) shows a relatively small area of inundation within Tukwila. The recent US Army Corps of Engineers (the Corps) model, developed for the Semi-Quantitative Risk Assessment (SQRA) of the Tukwila 205 Federal levee, showed a much larger flood footprint within the City at a roughly equivalent overtopping flood event (1 :490 AEP). This speaks to the need to coordinate with the Corps and stakeholders to develop a consistent baseline from which to advance a corridor plan that is most responsive to real flood hazards. In addition, Appendix B, figures 3-3, 3-4 and 3-5, which demonstrate the maximum inundation extents for each of the three alternatives, show no discernible flooding differences between these alternatives.

Response to J-2-8

The modeling for the PEIS is intended to compare programmatic approaches to flood hazard management and discern differences among the three alternatives. As described in PEIS Chapter 4 and Appendix C, all three alternatives could substantially reduce the amount of land area that is at risk of inundation during a flood event compared to today’s conditions.

Comment J-2-9

2. We note that the draft PEIS, and the proposed alternatives therein, addresses only levee overtopping scenarios at the 18,800 cfs event. Based on the SORA and the City's prior levee accreditation study (NHC, 2016) Tukwila's Federal 205 levee is vulnerable to breaching at certain locations during less extreme events than the 18,800 cfs overtopping event. The Plan should include discussions of existing levees and their vulnerability to the most likely potential failure modes.

Response to J-2-9

The modeling for the PEIS is intended to compare programmatic approaches to flood hazard management and discern differences among the three alternatives. Under all three alternatives, existing PL 84-99 levees would be improved to meet the 18,800 cfs level of protection.

Comment J-2-10

3. The Plan should be closely coordinated with the City's Comprehensive Plan and specific sub-area plans to develop a planned multi-benefit approach that creates opportunities and synergy with the City's vision.

Response to J-2-10

The three alternative approaches to flood hazard management consider adjacent land use. If the District moves forward with a Plan, Alternatives 2 and 3 include adaptive management, enabling the District to take advantage of land use changes. Alternative 3 specifically seeks to maximize levee setbacks through coordination with the local jurisdiction.

Comment J-2-11

4. Flood Facility Project Types A and B both show armored banks with riverward slopes steeper than 3: 1. These facility types are prominent in all alternatives, particularly for the "improvements to existing facilities category", and even Alternative 3 has a preponderance of these facility types, with Type A having the greatest lineal extent of all facility types. In developing the corridor plan, we encourage the District to revise these facility types in order to comply with local regulations and to align with best available science and recommendations as stated in the WRIA 9 Salmon Habitat Plan.

Response to J-2-11

The policy-level framework for each alternative guides the application of the flood facility types. Type A facilities are applied in areas that are most constrained, typically by the adjacent land use. Under Alternative 3, through ongoing collaboration and coordination, opportunities to set facilities farther from the river could be explored.

Comment J-2-12

5. We encourage the opportunities to install more tree and shade along the banks of the river in order to help with address temperature concerns in the water.

Response to J-2-12

The PEIS evaluates potential effects of each alternative approach to flood hazard management on water quality, including temperature. Please refer to Appendix B Section 4 and Chapter 4 Section 4.5.

Comment J-2-13

6. The Plan should utilize the District's stormwater authority to implement regional stormwater treatment actions in association with multi-benefit flood hazard management projects. The Plan should examine opportunities to make strides toward achieving regional stormwater water quality goals. One of those goals is King County's goal to build 30 strategically sited regional stormwater parks that capture and treat large stormwater contributing areas and provide a community amenity. We encourage the District to leverage stormwater parks and/or other regionally-significant water quality improvements with flood hazard management projects to improve water quality, create community amenities, improve salmon habitat and reduce flooding impacts.

Response to J-2-13

The PEIS examines alternative approaches to integrated flood hazard management, including sustainable and clean water.

Comment J-2-14

7. We support establishing corridor-wide performance measures related to flood protection, floodplain creation, buffer and canopy creation, off channel habitat creation, recreation and economic benefits and effects on communities, among others. Many of these performance measures should align with those already developed by WRIA 9 and in consultation with stakeholders who hold data and are involved, or interested, in various other performance measures. We encourage establishing a set frequency of adaptive management review and consistently reporting on findings with recommendations for adaptation.

Response to J-2-14

Thank you for your comment. If the District moves forward with a Plan, the District would establish a process to periodically evaluate progress under the Plan based on established goals and indicators.

Comment J-2-15

8. The Plan should consider long-term maintenance costs and obligations and be coordinated with the operations and maintenance protocols and procedures as described in the System-wide Improvement Framework (SWIF) and the in-progress King County Flood Hazzard Management Plan. Costs should reflect ongoing stewardship responsibilities and obligations for plantings, recreation, furnishings, amenities and trail maintenance.

Response to J-2-15

Thank you for your comment. Maintenance is managed on a County-wide basis, rather than as part of an area-specific plan.

Comment J-2-16

9. In appendix C on page C-48 there is a footnote indicating that agricultural data was pulled from Washington State Department of Agriculture. Tukwila South is shown as agriculture versus vacant commercial. This is incorrect. Tukwila Valley South is a Comprehensive Plan & Zoning Map designation in line with a development agreement that includes a variety of built land uses. Please update this information to reflect the City's adopted plans.

Response to J-2-16

The final PEIS corrects this designation, not only in this table, but in subsequent presentations of impacts by land use.

Comment J-2-17

10. The following critical facility inventory needs to be updated for Tukwila:

Facility	Location	Update
Fire Station #51	17951 Southcenter Parkway	Facility has moved to this new location.
Bloodworks Northwest		Remove: no longer in Tukwila
Minkler Public Works Facility	600 Minkler Boulevard	Add public works maintenance facility.
Sound Transit Station	7301 Longacres Way	Add as a critical facility.
BioLife Plasma Services	5951 180th St, Suite 101	Consider adding as a critical facility.
Police Department	15005 Tukwila International Boulevard	Facility has moved to this new location which is outside of LGR study area.
Holden Southcenter	112 Andover Park E	Add assisted living and memory care facility.

Response to J-2-17

The final PEIS Sections 3 and 4 note that data analyzed typically reflects conditions as of 2020, and conditions may have changed between then and the publication date. The final PEIS incorporates facilities identified by the City that were in place at that time in Sections 3.1 and 3.7 as applicable.

Comment J-2-18

11. Table 3-15 states Tukwila has 536 housing units within the corridor as of 2020. Tukwila currently has 644 units and will be adding another 285 units with the Prose Southcenter project, slated to begin construction in 2023.

Property Name	Address	Units
Marvelle/Mariblu – 55+	411 Baker Boulevard	166
Holden Southcenter – Assisted Living	112 Andover Park E	107
Airmark	229 Andover Park E	371
Prose Southcenter – In Construction	500 Baker Boulevard	285

Response to J-2-18

The final PEIS Sections 3 and 4 adds a note that data analyzed typically reflects housing conditions as of 2020, and conditions may have changed between then and the publication date.

J-3: King County Road Services Division

Comment J-3-1

Thank you for the opportunity to comment on the Lower Green River Corridor Flood Hazard Management Plan Draft PEIS. This plan will help ensure that public safety and access in the Green River Valley is protected in the face of potential catastrophic flooding impacts, and that the significant positive economic impacts of this area are maintained. I am providing the following comments on behalf of the King County Road Services Division. The King County Road Services Division has reviewed the draft PEIS, and has the following comments:

Response to J-3-1

Thank you for your comments.

Comment J-3-2

The unincorporated area within the PEIS study area is uniquely vulnerable to flooding impacts, with a majority of the unincorporated area being inundated under all alternatives. Alternative 1 ("no action") appears to provide a higher level of preservation and maintenance of the unincorporated King County Road system than the other alternatives. Alternatives 2 and 3 support flood protection, but primarily emphasize and promote habitat conservation and fish restoration benefits. If the following comments can be incorporated into the selected alternative, however, protection of the County Road system could be improved significantly.

Response to J-3-2

PEIS Appendix C Table 4-24 presents transportation inundation for each alternative by the type of transportation facility and by jurisdiction. As shown, the three alternatives have relatively similar impacts to local roadways. The final PEIS adds the following conceptual mitigation approach to Appendix C Section 5: Coordinate with and provide flooding information to transportation officials to inform the separate planning efforts and capital investment strategies of these agencies.

Comment J-3-3

The maintenance of the existing levee system is the single most important factor in continuing to provide safe access for local residents and businesses in the event of an emergency requiring immediate evacuation and should be prioritized under the selected alternative. Maintaining safe and clear access to business and residential properties must be a high priority under the selected alternative. Existing roadways that are vulnerable to flooding projections assumed in the PEIS must be kept in good condition in order to allow people to get out quickly and safely in case of evacuation. Existing freight corridors are critical economic assets that must be maintained and protected from flood events. Truck traffic access should be prioritized in the selected alternative to minimize negative impacts on the local and regional economy.

Response to J-3-3

As noted in the comment, preservation of evacuation routes is an important consideration guiding the District's actions. An element common to all alternatives is to protect and not isolate housing and neighborhoods. Each of the three alternatives evaluated in the PEIS identifies an approach to flood hazard management where there are existing levees. After applying these approaches, the results are projected in the inundation maps presented in the PEIS Chapter 4. Further, PEIS Appendix C Table 4-24 presents inundation of designated truck routes, with similar results for the three alternatives.

Comment J-3-4

For Hydraulic Modeling, it is noted that inundation of a roadway alone would not constitute flood need unless the road was categorized as a principal arterial, highway or freeway by the local jurisdiction, or would provide sole access to residential areas. However, impacted unincorporated roads south of downtown Kent are mostly minor or local roads. We recommend including all roadway classifications in this analysis. For modeling and evaluation relative to levees or floodwalls, the district "would not eliminate vehicular access without reasonable replacement". "Reasonable replacement" should be defined in greater detail. Prioritization of facilities in need of replacement should also be defined. Any proposed acquisition, condemnation, relocation, or other action involving County Road right-of-way must be coordinated with the Road Services Division. King County roadway Level of service standard is noted as typically E in urban areas – however, the unincorporated area within the PEIS study area is rural, and has a level of service standard of B.

Response to J-3-4

To clarify, the inundation of local roads has been included in the analysis presented in PEIS Appendix C, as demonstrated in Table 4-24. However, the District would not take action to address inundation of a local road absent other considerations, unless the local road provides sole access to residential areas. In areas where construction of new levees or floodwalls or relocation of existing levees or floodwalls would impact a roadway, reasonable replacement could take the form of relocating the roadway landward of the levee or floodwall or ensuring that the area can be accessed by an alternative route. These details would be determined during project-specific design and permitting.

Comment J-3-5

The King County Transportation Needs Report was cited as a source of trail project information, when Parks plans should be used to identify trail projects.

Response to J-3-5

Trails often serve as both transportation and recreation facilities. The PEIS considers the applicable planning documents for both. Information from Parks plans is included in PEIS Appendix C Section 3.7.

J-4: City of Kent (public meeting transcript)

Comment J-4-1

MR. MACTUTIS (providing comment): Yes, thank you. And I want to thank you for -- for all the time and effort that's been put together with this document and all the appendices. It's -- it's a -- it's -- it's a real comprehensive study, so we are spending a lot of time taking a look through it, and we will have written comments, but I had a couple of questions that I just thought I might as well bring up right now, from -- just a couple of small things that I saw in there.

Response to J-4-1

Thank you for your support and for your comments.

Comment J-4-2

MR. MACTUTIS (providing comment): In section 2.1 of the -- of the EIS, there was a mention of flooding up to 40 feet deep in 10 places, and I am not sure where that is. I couldn't find reference to it in another part of the document, so if somebody knows the answer to that or can get back to me on that, that -- that would be something that would be helpful just to know because I don't -- I don't know of any places where, even in an 18,000 CFS flood, that -- that we'd get 40 feet deep of flooding, other than in the middle of the river.

MS. BAILEY (staff): We would be happy to get back 19 to you with that one. It's -- it's not something I can answer –

MR. MACTUTIS: Okay. Great. Thank you.

MS. BAILEY: -- immediately.

Response to J-4-2

Please refer to the response to comment J-1-6.

Comment J-4-3

MR. MACTUTIS (providing comment): I think that was the only real question I had. I have a number of comments. One -- I guess one of the ones I'll bring up is that there was some discussion in the document about protecting agricultural areas up to 11,900 CFS, but allowing them to flood after that. I am -- I am not clear how that would even be possible because those agricultural areas, at least the ones south of Kent, are connected by open creek systems and -- that -- that are habited by endangered species, and that those -- those agricultural areas start -- the water starts backing up from the river at a much lower level, like, I believe it's around 6,000 CFS where the water starts backing up. So if tho- -- if that water is kept in the river up to 11,900, that will change the character of the river for that time.

MS. BAILEY (staff): We'll look forward to seeing your comments on that.

MR. MACTUTIS: Okay. Yes. We -- we will have comments coming before the deadline. Thank you.

Response to J-4-3

Please refer to the response to comment J-1-7.

J-5: City of Tukwila (public meeting transcription)

Comment J-5-1

MS. EDQUID (providing comment): I just -- how was your guys' -- how did you calculate future populations, or what did you use?

THE COURT REPORTER: Can I ask who's talking?

MS. EDQUID: Sorry. This is Sherry from Tukwila.

MS. CLARK (District Executive Director) : Can you provide your last name and spelling, Sherry --

MS. EDQUID: It's –

MS. CLARK: -- and the title if you want that as well in the record.

MS. EDQUID: It's Sherry Edquid, E-D-Q-U-I-D, and it's City of Tukwila. I'm a project manager -- or I'm the levee and floodplain project manager.

MS. CLARK: We want to give you your due credit, Sherry.

MS. BAILEY (staff): Hi, Sherry. If you take a look at Appendix C in the PEIS, there is the Affected 6 Environment section of Appendix C that gets into the details and cites the sources for things like population and population forecasts by jurisdiction, and so I would encourage you to look there. I -- I can't cite it off the top of my head, but that's where you can find that information.

Response to J-5-1

The methodology table in PEIS Appendix C notes that future population forecasts are based on Puget Sound Regional Council's Land Use Vision (LUV) forecast from 2018. This data product forecasts population by small area "transportation analysis zones" that allow for analysis of potential future conditions at the sub-jurisdictional scale.

Comment J-5-2

MS. EDQUID (providing comment): Okay. Yeah, that's helpful. One other thing, you guys -- I mean, this is just a general comment. Michelle, you know where the Segale property is. They're classifying it as agricultural, so –

MS. CLARK (District Executive Director): That's good to know.

MS. EDQUID: -- and -- yeah, so obviously, that's not -- (Crosstalk.)

MS. CLARK: But is that what it's currently zoned as in Tukwila?

MS. EDQUID: I'd have to look, but I mean -- but I mean, we have -- we have a development agreement, so, I mean –

MS. CLARK: I understand, Sherry. But if it is what the current land use is, then, unfortunately, that's what it will stay. But we will definitely check –

MS. EDQUID: Okay. Thank you.

MS. CLARK: -- because all we can do is reflect the laws of the jurisdiction and their land use codes and their land use maps. But we will definitely check on that. Thank you.

MS. EDQUID: Okay. Yeah.

Response to J-5-2

The final PEIS corrects this designation, not only in this table, but in subsequent presentations of impacts by land use.

J-6: Seattle Public Utilities

Comment J-6-1

Thank you for the opportunity to comment on the Lower Green River Corridor Flood Hazard Management Plan and Programmatic Environmental Impact Statement (PEIS). While the Green River and scope of the PEIS is outside of Seattle, we have keen interest in the overall health and management of the Green-Duwamish River. The Duwamish portion of the river flows through Seattle and is our only river. We are also an active participant in the WRIA 9 salmon recovery and watershed restoration efforts.

Response to J-6-1

Thank you for your comments.

Comment J-6-2

Seattle supports multi-benefit approaches which are most completely addressed by the Alternative 3 framework. Alternative 3 has the strongest nexus and benefits to address flooding while also supporting salmon recovery. We concur and support the multi-benefit approaches that re-envision land use to protect communities from flooding, supports habitat, enhance economic development opportunities, and provides diverse recreational opportunities along the river corridor. Floodplain management in urban areas is challenging. We encourage the District to work collaboratively with local officials to show how flood reduction can also support goals for environmental, economic and community revitalization.

Response to J-6-2

Seattle's support for the multibenefit framework under Alternative 3 is noted. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process. This process will incorporate information from the PEIS, including comments and findings. The Board will also accept comments as part of its deliberation.

Comment J-6-3

However, all three alternatives note if levees are constructed or raised, this will result in increased peak flows and overbank flooding downstream of River Mile (RM) 11. In Appendix B, these are noted as small events, although not well explained. It would be helpful to more fully understand the potential magnitude of the downstream impact over time. The resulting flooding events would be in the Duwamish River, which, as you know, already experiences river flooding issues further downstream. While the impacts from implementation of this plan may be small, Seattle requests a more holistic look at the river, including the impact of upstream work on flooding risk downstream. The plan and PEIS do not adequately convey the sense of the entire river system.The documents also need to better explain how this plan might fit into the important update to the King County Flood Hazard Management Plan update. We would like to understand how the needed investments in these alternatives align with the County flood hazard management priorities and county-wide investments. We appreciate the District's work to address flooding needs in the Green River Corridor and the opportunity to comment on this important effort.

Response to J-6-3

The draft PEIS discloses potential changes in surface water elevation downstream of river mile 11 but does not discuss the extent of flooding or implications on downstream land uses. To address your comment, the final PEIS explains the results in Appendix B and other locations, where appropriate. The final PEIS also includes new text on Page 4-5 to explain the role of hydraulic modeling during project implementation to ensure that flood risk is not transferred upstream or downstream. With respect to the County's Flood Hazard Management Plan, as noted in Appendix A Section 2.1.1, the Lower Green River Corridor Flood Hazard Management Plan would be a basin-specific plan under the umbrella of the District's Comprehensive Plan of Development. The 2006 King County Flood Hazard Management Plan serves as the District's Comprehensive Plan of Development.

O-1: American Rivers

Comment O-1-1

Dear Ms. Clark, Our organizations respectfully submit the following comments on the proposed Lower Green River Corridor Flood Hazard Management Plan Draft Programmatic Environmental Impact Statement (PEIS) issued March 20, 2023. Thank you for the opportunity to provide feedback on the alternatives included. The Green-Duwamish was once one of the largest salmon producing rivers in the Puget Sound – critical to Chinook salmon, the Southern Resident Killer Whale (Orcas) and the tribal nations that rely on it. The last century brought rapid growth and industrial and commercial development to the valley, to the great economic benefit of the region and nation. However, this development channelized the river and destroyed the ecology of the watershed. While the District did not cause these problems it is in a position to address them.

Response to O-1-1

Thank you for your comments. Please see our specific responses below.

Comment O-1-2

The Lower Green is a bottleneck for Chinook salmon recovery and improvements here are essential to realizing the benefits of over $1 billion in investment the watershed over the next 10-years - including $900-million for fish passage at Howard Hanson Dam and $600-million for cleanup plans for the Lower Duwamish and East Waterway. Along with these areas, the Lower Green is one of the largest limiting factors to salmon recovery in the watershed. The levee system in the Lower Green forms the skeleton of the river and any proposed actions must work within these structures so the decisions made now will dictate opportunities for the next century. It is critical that the District take every opportunity to maximize multiple benefits by setting back levees to create more flood storage, off channel habitat, shade and equitable open space and recreational opportunities. The Endangered Species Act, Clean Water Act, Temperature Total Daily Maximum Load (TMDL), and tribal treaty rights are legally binding obligations that The King County Flood Control District must address with its preferred alternative. Thankfully, these obligations can be met by designing multibenefit projects that reduce flood risk, restore habitat, improve water quality, and support the $8-billion economy and the 134,000 jobs in the Lower Green River Valley. For too long, economic development and restoration have been viewed as incompatible in the Lower Green - but that is not the case.

Response to O-1-2

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat.

Comment O-1-3

Communities across the country have experienced similar historic development and economic development pressures along their river corridors but have found that making more room for the river results in better environmental, social, economic, and recreational outcomes for their communities. Notably, since the 1970's the City of Denver has invested approximately $130 million to reduce flood risk to vulnerable communities, restored aquatic habitats and created a vibrant recreational corridor along the South Platte River. These investments have resulted in over $10 billion in new economic development outside of the floodplain. The river is now the largest recreational and outdoor educational destination in the city and one of the principal drivers of economic growth. Thanks to a common vision for the river shared across multiple diverse interests' investments continue to flow and the city was just awarded $550 million from the U.S. Army Corps to revitalize an additional 6.5 miles of the river. Now the communities of Kent, Tukwila, Auburn, and Renton have agreed to work with the County and other partners over the next 6-months on the early stages of a similar vision. Funding has been secured in the King County and District budget to support these local communities as they work to develop guiding principles for Lower Green River management with an eye toward scoping a larger river vision that could realize the true potential of the Lower Green over the next 30-50 years. Our organizations support this process of local self-determination and request that the District does not move forward with any alternative that could prohibit future actions prematurely by setting levees too close to the river.

Response to O-1-3

As noted in this comment, addressing flood risks in the Lower Green River Corridor is a large undertaking that could span 30 to 50 years. Regardless of the alternative selected, the District will continue to communicate and coordinate with local jurisdictions as it implements flood hazard management actions.

Comment O-1-4

Our organizations submitted comments on the alternative scoping in February 2022 and an early version of this Corridor Plan released on November 28, 2018. Since then, the District has made a significant effort to revise the alternatives presented and work collaboratively across multiple interests to develop integrated solutions. Notably, the District's Board of Supervisors unanimously passed Motion FCD 20-07.01 that committed the District to pursue integrated floodplain management approaches that address multiple benefits and principles of environmental stewardship, equity and social justice and environmental justice. We applaud this action by the District and believe that any alternatives must operationalize the intent of this policy to realize a brighter future for the Lower Green River Valley. The following recommendations aim to help the District's Board of Supervisors finalize this PEIS and move forward with the Corridor Plan:

Response to O-1-4

Thank you for your comment.

Comment O-1-5

Approve the development of a Lower Green Corridor Flood Hazard Management Plan (Plan) for Alternative 3, with a few minor modifications

As described in the PEIS, Alternative 3 is the only alternative that embodies the District's commitment to deliver multi-benefit projects throughout the corridor. In 2021 the King County Flood Control District, along with Lower Green communities, companies, agencies, NGOs, and other special purpose districts adopted the 2021 Green/Duwamish and Central Puget Sound Watershed Salmon Habitat Plan as part of their role on the WRIA 9 Watershed Ecosystem Forum. Alternative 3 of the LGFMP is the only alternative that meets the agreed upon 10-20 year salmon recovery goals of this plan. If this is a 30-50 year plan, Alternative 3 should outline a process to include the long-term salmon recovery goals after the initial goals are completed. Although Alternative 3 provides significantly more benefits to salmon, we acknowledge the need for tradeoffs between multiple interest groups within the watershed. Impacts to and potential loss of industrial, commercial, and residential lands cannot be taken lightly. The Corridor Plan is a 30-50-year plan, and it must be developed and implemented in concert with local land use planning. If done collaboratively as part of the larger river vision currently under development, we believe there is an opportunity to ensure the gradual transition or relocation – as opposed to loss – of impacted land uses (e.g., housing and businesses). This will leave a stronger and more resilient Lower Green River Valley that continues to serve as an economic powerhouse for the region, and for Washington State.

Response to O-1-5

Thank you for providing your thoughts on Alternative 3. The District is a primary funder for WRIA 9 and supports salmon habitat projects done by WRIA 9 in the Lower Green River Corridor and elsewhere. As WRIA 9 updates its recovery goals and develops longer-term goals, the District could consider under adaptive management whether its own goals should be updated.

Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

Comment O-1-6

The projected differential impacts between alternatives – although significant – must be viewed in relation to the benefits provided by providing 500-year flood protection to the larger Lower Green River Valley. Under existing conditions, a 500-year flood would be devastating. Modeling suggests an event like this would flood 5,700-8,500 acres of land, displace 27,800-41,700 residents, and impact 28,20-42,200 jobs. All three alternatives significantly reduce these potential flooding impacts by nearly 50 percent or more. Although Alternative 3 would impact between 4,440 and 8,200 more jobs than Alternatives 1 and 2, plan implementation would occur over 30-50-years allowing for significant transition or relocation of those jobs within safer or more appropriate areas within the valley and may likely result in more higher paying jobs because the highest and best use of riverside lands can be realized.

Alternative 3 would also impact an additional 90 to 140 acres of land over Alternatives 1 and 2 due to new, improved and relocated facilities. This represents an impact of less than 1 percent of the historical floodplain and 2 percent of the existing area of industrial and commercial land uses within the Corridor. The projected impacts to $23M- $34.8M of commercial and industrial improvements – while again clearly significant – represents less than 1 percent of the total estimated assessed value of improvements within the Lower Green River Corridor.

The total differential cost for implementation of Alternative 3 is somewhere between $190M and $730M above Alternative 1 (less for Alternative 2). Although clearly a significant cost, it represents between 2 and 9 percent of the $8 billion in annual taxable revenue generated within the Lower Green River Corridor and is lower than other large integrated floodplain management efforts across the state. Considering the 50-year planning horizon, it represents less than 0.2 percent of projected taxable revenue to be collected across the Corridor over the next 50 years. That is a very reasonable investment to increase the resiliency of the Lower Green River Valley to elevated flooding concerns that come with projected shifts in our regional climate.

Response to O-1-6

Thank you for reviewing the flooding results and planning-level costs communicated in the PEIS and providing your thoughts regarding Alternative 3. The District Board of Supervisors will consider the costs, impacts, and benefits of the alternatives, as presented in the PEIS and submitted in comments, in determining its direction. Please refer to the response to comment O-1-5.

Comment O-1-7

Alternative 3 also includes new flood protection facilities designed to provide flood protection for agricultural lands up to 11,900 cubic feet per second. These new facilities would be built within the County's Agricultural Protection District (APD) and appear to be in conflict with the existing King County Code (21A24.045). New facilities could also unintentionally strand juvenile ESA listed salmon that enter agricultural land during a high flow event and cannot escape. The draft PEIS does not appear to account for this potentially significant impact. These new facilities should be removed from Alterative 3, and the final or preferred alternative and flood proofing and elevations should be available for residents in this area.

Response to O-1-7

The potential for outcomes like fish stranding and consistency with code requirements are best addressed during project-specific design, modeling, and permitting. Each project must comply with applicable regulations. The final PEIS adds explanation acknowledging the complex regulatory requirements in the Summary, Chapter 3, and Chapter 4. The final PEIS Section 4.2 adds explanation of the role of hydraulic modeling during project implementation. This same information is summarized in the final PEIS Summary Section S.12.

Comment O-1-8

Although we encourage the District to move forward with a modified Alternative 3 as the preferred alternative, our organizations do not endorse the specific facility alignment proposed in any of the spatial renderings. The spatial renderings are useful to support high level comparison and analytics, but they are not appropriate for evaluating site specific impacts. The final project level alignment of future facilities requires more specific analysis of site-specific opportunities and a thorough discussion of tradeoffs between interest groups. The forthcoming Corridor Plan must be closely coordinated with both local land use plans and the King County Flood Plan Update. It should also reflect the results of the anticipated District-funded Lower Green River Visioning effort that will bring together the Lower Green Corridor city mayors and the County Executive's Office.

Response to O-1-8

Please refer to the responses to comments O-1-5 and O-1-6. The facility alignments shown in the referenced graphics are intended to be illustrative and are not actual proposals. Future projects proposed by the District would undergo project-specific environmental review and permitting. Regardless of alternative selected, the District will continue to coordinate closely with local jurisdictions.

Comment O-1-9

<u>Approve a sequencing plan for existing and planned projects while the final Lower Green River Corridor Flood Hazard Management Plan is developed</u>

Local jurisdictions and partners have millions of dollars in existing projects already in the planning and design phase and spent significant time developing the USACE System Wide Improvement Framework (SWIF) for the river. These projects should not be put on hold while the District develops a Plan. Instead, the District should continue to support their development using the policy framework and decision making hierarchy outlined in FCD Motion 20.07.1 and Alternative 3. The request for comments on the Draft Lower Green PEIS indicates that a Final PEIS and preferred alternative could be issued by mid-2024 and then the Board could direct preparation of a Flood Hazard Management Plan. The request also notes that under any alternative individual projects would have project-specific environmental review as part of the design and permitting process. Tuk 205 Gunter, Desimone, Breda, McCoy, Milwaukee#2, Signature Point represent approximately four miles of projects reviewed in the Draft PEIS are already in design and included in the District's 2023 approved 6-year CIP. Another four miles are anticipated for initiation in the next decade, including flood facility improvements along the federally authorized Tukwila (Tuk 205 Ratolo, Tuk 205 Christensen) and Tukwila South levee systems. These projects will establish the "footprint" for flood risk reduction, habitat restoration, and attainment of other community benefits for generations to come.

Response to O-1-9

If the Board of Supervisors decides to proceed with a Plan, the District will continue to implement its 2022-2027 CIP and respond to emergency needs.

Comment O-1-10

PEIS Alternatives 2 and 3 are based on a corridor-wide planning process informing project design. If a Lower Green Flood Hazard Management Plan is not completed for an extended period (if at all), then it will be essential to have a clear framework in place to support reach scale assessments of multi-benefit opportunities and impacts as individual projects proceed. Without this framework, it appears that project planning and design will default to PEIS Alternative 1, "project-by-project multi-benefit".

As part of issuing a Final PEIS and preferred alternative, the District should identify the framework (policies, planning resources, tribal consultation commitment, and community engagement strategies) that will guide identification and evaluation of project alternatives in a reach-scale context for any projects proposed to advance in the absence of a Lower Green Flood Hazard Management Plan. This framework should identify the sources of information like the WRIA 9 Salmon Recovery Plan; city and county parks, open space, and trails plans; critical infrastructure plans; and city and county Shoreline Management Plans that will be consulted in scoping and analyzing project alternatives. Reach-scale assessments of multi-benefit opportunities and impacts should be sequenced based on current and pending CIP projects.

We have a shared opportunity to develop this framework in more detail as part of the "Visioning" process to which the County and FCD have each contributed $50,000 in funding in 2023. Additionally, the current update to the King County Flood Hazard Management Plan (scheduled for completion before the first half of 2024) includes a focus on multi-benefit policies and could help to inform this framework.

Response to O-1-10

Please refer to the response to comment O-1-9 above. The final PEIS does not identify a preferred alternative. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

Comment O-1-11

Develop a flood storage analysis to inform the final PEIS

The Draft EIS acknowledges the significant benefit of flood storage and its compatibility with juvenile ESA listed salmon rearing habitat in the Lower Green River. The recently constructed Downey Farmstead project alone reduced water surface elevations by over 6-inches and the impacts of the project were felt all the way up to Auburn. If one project can have such a pronounced impact on water surface elevations, the District must incorporate all of the salmon recovery projects in the Lower Green into their modeling before finalizing the PEIS. These projects could provide significant flood storage impacts that could reduce the height and width of the flood facilities leading to less environmental impacts. Members of our organizations repeatedly asked the district to conduct this analysis during the development of the Draft PEIS, but it was not completed.

Response to O-1-11

PEIS Appendix E includes planned salmon recovery projects in the cumulative effects analysis, consistent with the programmatic level of environmental review.

Hydraulic modeling of the salmon recovery projects is not necessary for programmatic review. Hydraulic modeling for the PEIS is intended to compare differences among the alternatives and evaluate potential impacts at a programmatic level. Incorporation of the salmon recovery projects into the modeling is not expected to create discernible differences among the alternatives. Further, the PEIS modeling is not intended to determine the dimensions of a specific flood facility. Instead, these dimensions would be determined during project-specific modeling and design. The implications of salmon recovery projects for which there is sufficient information could also be incorporated into the analysis at that time. The final PEIS Section 4.2 adds explanation of the role of hydraulic modeling during project implementation. This same information is summarized in the final PEIS Summary Section S.12.

Comment O-1-12

It is also unclear why Alternative 3 would result in more flooding of farmland from River Miles (RM) 21.5 to 27.5 at 18,800 cubic feet per second. Alternative 3 appears to involve fewer Type 1 and Type 2 facilities and more levee setbacks that would provide increased flood storage. The additional flood storage capacity associated with Alternative 3 would seem to support reduced flooding risk of agricultural lands under Alternative 3. The final PEIS should provide enhanced clarity around the rationale behind differential flooding of agricultural lands in this reach between the three alternatives.

Response to O-1-12

The PEIS describes the hydraulic modeling as based on planning level application of the alternatives and the general conditions found in the corridor. At this generalized level, upstream of the main agricultural areas, Alternative 3 has slightly lower water levels than the other alternatives during the 18,800 cfs flood event. Downstream of the agricultural areas, Alternative 3 has slightly higher water levels than the other alternatives during the 18,800 cfs flood event. These differences are small and point to considerations that would be important to address in further planning. As projects are implemented over the 30- to 50-year planning period, project-specific modeling and design will be required to ensure that flood risk is not transferred.

Comment O-1-13

Additionally, sea level rise was not modeled as part of the Draft PEIS and tidal influences were considered negligible. However, USGS gauge data already shows tidal influences on flooding as far upstream as Kent and it is assumed this will only be exacerbated by sea level rise and should be modeled as part of the final PEIS.

Response to O-1-13

Hydraulic modeling of sea level rise is not necessary for the programmatic level of review. The purpose of the PEIS is to compare three alternative approaches for flood hazard management in the Lower Green River Corridor. Sea level rise is not seen as a differentiator among the alternatives because it would impact them all in a similar way. However, it should be considered as projects are implemented over the 30- to 50-year plan. The final PEIS Section 4.2 adds explanation of the role of hydraulic modeling during project implementation. This same information is summarized in the final PEIS Summary Section S.12. Additional explanation of how the District would consider best available science is provided in the final PEIS Section 6.5.

Comment O-1-14

<u>Support the creation of a locally lead Lower Green River Vision and a multidisciplinary advisory group to inform the planning, design and prioritization of integrated floodplain management projects</u>

Conflict between flood control, restoration, economic development, and recreational needs have plagued planning efforts along the Lower Green for decades. The development of a locally led Lower Green River Vision could unite these complementary needs into an integrated plan with broad support across multiple interests. As previously stated, funding has already been appropriated for the first step in this process and local leaders are excited to get started. The District should continue to support this effort and should approve a final PEIS that provides the most room for multiple benefits.

A Lower Green River Vision would take a holistic planning approach but would likely follow a reach-by-reach framework for pursuing acquisitions and developing conceptual designs. It would include significant public engagement and sustained collaboration across a diverse multidisciplinary advisory group. We encourage the District to support this effort and use this broadly supported process to help inform the final Corridor Plan.

Furthermore, this effort would allow diverse interests to discuss tradeoffs at a larger reach scale and may help alleviate the frequent frustrations felt by all interests in the current project-by-project approach. Tradeoffs may be more palatable at a larger scale and even result in larger more significant benefits than at the single project scale. It could also define a proactive long-term approach to voluntary acquisitions that would helpfully minimize or avoid the potential need for condemnation.

Response to O-1-14

The District Board of Supervisors will consider your comment as it determines the path forward for the Lower Green River.

Comment O-1-15

Increase equitable access to open space and parks

Communities throughout the Lower Green, including the City of Kent, view the river as their greatest natural and recreational amenity. Projects like Lower Russell have proven the benefits of incorporating recreation and restoration into large reach scale projects. However, over 50% of Kent residents are considered low income and do not have the ability to travel for recreation. Some families are even fined for their children playing in their apartment complex parking lots because they have nowhere else to go.

Alternative 3 reduces the extent of flooding on parks and open space by 34% and includes a differential of 30-50 acres at 18,800 CFS as compared to Alternatives 1 and 2. While parks and open space areas are critical to the quality of life and recreational opportunities of residents, occasional flooding is a compatible use especially when you consider the percent of annual occurrence is only 0.02%. Improvements to flood facilities as proposed in Alterative 3, would create more room for parks and open space and when combined with the larger Lower Green River Vision could result in more pedestrian transportation routes to increase resident's access to nature in their own backyard.

Improvements could also include new river access points and boat launches which can be designed to be compatible with restoration goals as has been demonstrated at Lower Russell and Duwamish Gardens Park. Additionally, a robust body of literature shows that recreation can benefit from environmental restoration and a healthy environment creates the foundation on which many of the best recreational experiences are built.

Response to O-1-15

Thank you for reviewing the flooding results and PEIS evaluations of how parks and open space may be affected under the three alternatives. Please refer to the responses to comments O-1-5 and O-1-6.

Comment O-1-16

That being said, restoration and recreation are not on the equal legal standing. The District's has legal obligations under ESA, Clean Water Act (303D list for temperature and bacteria) and Tribal Treaty Rights that it must uphold. Under FCD Motion 20.07.1 and Alternative 3, the District should support environmentally friendly recreation but legal obligations for restoration must not be compromised for recreation.

Response to O-1-16

Under any alternative the District will adhere to all regulatory and legal requirements. An element common to the three alternatives is to honor and respect Tribal and treaty reserved rights. PEIS Appendix E describes Tribal treaty rights and interests on the Lower Green River Corridor.

Comment O-1-17

Some recreational facilities like the Green River Trail are not river dependent but benefit from river views along the way. If a trail currently runs atop a levee and that levee is setback, the District should work with recreational and environmental interests on the new multibenefit design that maximizes flood storage, salmon rearing habitat, recreation, education, and safety.

Response to O-1-17

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat. The intent of all three alternatives under consideration is to prioritize multibenefit projects.

Comment O-1-18

Climate resilience and adaptation goals require analysis of habitat and ecological connectivity of the riparian corridor

When employing concepts like climate resiliency or community resiliency it is often appropriate to take a holistic view of the processes and functions that govern healthy and robust ecosystems. Moreover, the key component to adaptation for both flora and fauna through a changing climate is not addressed at length and does not seem to be a part of the PEIS. Habitat and ecological connectivity are the few tools we have to actually accomplish a climate resilient landscape. The Green-Duwamish watershed connects patches of habitat and ecosystem processes from the urban settings in the Puget Sound into the Cascades. If climate change resiliency is a function of the project or analyzed in the PEIS, then connectivity must be an important piece of that work. How can it be improved? And how will it be impacted? What species could and do utilize this corridor? Whether an environment is urban, suburban or rural, wildlife and plants move along these riparian corridors for daily and seasonal needs and to adapt to extreme changes. If restoration is seeking resilience for climate adaptation, then connectivity must be a consideration at the least. However, if climate resiliency is to be achieved in part through restoration, then ecological connectivity is the most effective way to achieve it and thus must be included in the final PEIS. The District should include, explain, and determine impacts on habitat connectivity and ecological connectivity within the project area.

Response to O-1-18

Thank you for your suggestion. PEIS Appendix B Sections 2 and 5 discuss climate change and ecological impacts, respectively. An element common to all alternatives is to continuously study the effects of climate change and use best available science for flood hazard management planning, adaptive management, and facility design.

Comment O-1-19

Our organizations are committed to reducing flood risk and improving habitat for all people and animals within King County. The State Department of Ecology, FEMA, and the U.S. Army Corps of Engineers, amongst others, have already embraced this approach and are revising funding programs and guidance to support integrated floodplain management efforts. We believe this is a once in a generational opportunity for the District to actualize the adopted integrated floodplain approach, better position future projects for increased federal funding and build strong partnerships for the benefit of all residents. We greatly appreciate this opportunity to comment and encourage you to reach out if you have any questions on our recommendations.

Response to O-1-19

Thank you again for your comments.

O-2: Master Builders Association of King and Snohomish Counties

Comment O-2-1

King County Flood Control District, On behalf of the 2,500 member companies of the Master Builders Association of King and Snohomish Counties (MBAKS), thank you for the opportunity to comment on the Lower Green River Corridor Flood Hazard Management Plan Programmatic Environmental Impact Statement (PEIS) alternatives. MBAKS asks that the King County Flood Control District (District) please consider the following comments as the PEIS process moves forward. Whatever alternative is selected, we urge the District to strike the right balance between diligently mitigating the impacts of future flood risks and ensuring the housing needs of Lower Green River Corridor communities are met.

Response to O-2-1

Thank you for your comments. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat.

Comment O-2-2

1) MBAKS supports the creation of a Flood Hazard Management Plan.

- MBAKS encourages the District to proceed with the development and implementation of a new area-specific Flood Hazard Management Plan, as called for in Alternatives 2 & 3.
- Having a comprehensive Flood Hazard Management Plan in place would provide communities in the Lower Green River Valley with more certainty to make informed decisions regarding future land use actions.
- By clearly stating the County's strategies to manage flood risk, a Flood Hazard Management Plan would set a more certain path forward for communities to effectively plan for and mitigate potential disruptions caused by floods, maintain a strong and healthy economic base while also protecting our natural resources.

Response to O-2-2

Thank you for your comments and support of the Plan. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

Comment O-2-3

2) The District should integrate the housing needs of Lower Green River Corridor communities into flood management planning.

- MBAKS believes it is critical to shape a strategy that seamlessly aligns the objectives of effective flood management with the broader goals of addressing our region’s housing shortage.
- We urge the District to view the available PEIS alternatives through the lens of housing. The Puget Sound region is expected to grow by 1.8 million residents and 830,000 households by 2050, requiring more than 400,000 new homes in King County.

- Any Flood Hazard Management Plan that is adopted must integrate with the Growth Management Act and local comprehensive plans to ensure it addresses the need for more housing. Given our region's significant housing shortage, it is imperative that we take a comprehensive approach to flood management planning, that includes minimizing the displacement of established communities and ensuring adequate capacity to meet current and future housing needs.
- We urge the District to study the impacts of the PEIS alternatives on housing supply and how this intersects with flood hazard management work.

Response to O-2-3

Housing is evaluated in PEIS Chapter 4 and Appendix C Sections 3.2 and 4.2.2. Compliance with land use plans and policies is described in PEIS Chapter 4 Sections 3.1 and 4.1. The evaluation considers planned growth.

Comment O-2-4

3) Striking the right balance between the significant cost of flood management measures and flood risk is essential.

- Any alternative that is adopted should evaluate the costs of implementation, assessing impacts on land and ensuring effective risk mitigation without hampering economic vitality.
- Limited resources necessitate a balanced approach to flood hazard management, weighing costs and flood risks.
- The decision to invest in extensive 500-year level flood protection measures should carefully consider the trade-offs between required land and resources versus potential benefits.

Response to O-2-4

The District Board of Supervisors will consider your comments as it determines the path forward for the Lower Green River. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

I-1: Minutoli

Comment I-1-1

I live in the Lower Green River Corridor area and I support the objectives of the Lower Green River Corridor Flood Management Plan. However, there is a disconnect from what are the stated objectives and what is running shoe or bike tire or stroller wheel truth at the sanctioned use level. I also see a profound disconnect with ongoing maintenance after the plan has been completed. It also appears that this lack of ongoing maintenance of these sensitive areas are in conflict with the stated goals of the plan. It would seem that until King County addresses this discontent between it's stated goals in this project and links them to environmental truth at the watershed level, the outcome is suspect. Moreover, until this disconnect is solved the Lower Green River Corridor Flood Management Plan is just another taxpayer funded illusion foisted upon the public by King County with no hope of a working plan. Please prove me wrong and make the Lower Green River Corridor Flood Management Plan functional. Please answer the basic question: Who does what, where and when?

Response to I-1-1

Thank you for your comment. The District manages maintenance on a County-wide basis, rather than as part of an area-specific plan, and maintenance is not expected to make a discernible difference among alternative approaches to flood hazard management in the Lower Green River Corridor. However, your concerns are understood.

I-2: DiSimone

Comment I-2-1

Every effort should be made to return the area to it's original natural state. The less we interfere with mother nature, the more trouble we cause.

Response to I-2-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat.

I-3: Cotton-Betteridge

Comment I-3-1

There are many parallel, ancillary and even conflicting efforts in this WRIA. Hopefully they can all be simplified, unified and complementary. Things like fish habitat, conservation, expansion, and water quality should all be addressed along with flood protection.

Response to I-3-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat. In addition, Appendix F of the PEIS evaluates cumulative impacts, which are the result of the District's actions combined with past, present, and reasonably foreseeable action such as the efforts of WRIA-9.

I-4: Hall

Comment I-4-1

Probably shouldn't have allowed building in a flood plane. Since it's there, once places flood and need substantial relief, they should not be rebuilt. There should be large buffers on each side with natural vegetation.

Response to I-4-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat. The three alternatives offer varying amounts of vegetated buffer along the Green River.

I-5: Martinez

Comment I-5-1

We need to take better care of what is left of our environment, for wildlife, marine life, plant life, and people.

Response to I-5-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat.

I-6: Robinette

Comment I-6-1

This project should be shelved indefinitely. It reads more like an "agenda 2030" plan than a truly beneficial project. The absolute least should be done and no residences/ businesses should be affected or moved. The risk is simply not that great, period.

Response to I-6-1

Thank you for your comment. The Lower Green River Corridor is at risk of flooding. Some areas are at risk from floods at river flows well below the 18,800 cfs level studied in the PEIS. The purpose of the District is to protect people and property from floods. Under Alternative 1, the District would continue to manage flood risk without an area-specific plan (i.e., the current practice).

I-7: Stanfield

Comment I-7-1

Where exactly would the displacements be and what kind of compensation is being offered?

Response to I-7-1

Page 4-10 of the draft PEIS and Appendix C Built Environment, Table 4-4, describe the number of structures that could be displaced by each alternative. Table 4-4 in Appendix C summarizes the information by the general location. Table 4-6 specifically identifies potential residential displacements. A substantial proportion of these impacts would likely result from improvement to existing flood hazard management facilities, based on the conservative assumptions applied for this programmatic evaluation. As described in Section 5.1 of Appendix C, during project-specific design the District would endeavor to reduce the impacts to structures. Any acquisition and relocation of property and uses would be in accordance with the District's acquisition policy, described in Section 2.1.2 of Appendix A.

Comment I-7-2

Also will there be public meetings or online meetings about this?

Response to I-7-2

Public meetings were held in April 2023 to receive comments on the draft PEIS. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

I-8: Ekburg

Comment I-8-1

Option 1. Project by project. This has the least impact on private property. During the Covid lockdown and Antifa/BLM riots, people lost their jobs, business, home, and savings. They have not recovered. Keep costs low and the flood reduction we do have in place. Repairs must be done. People fired due to vaccine mandates, still do not have their jobs back. Homelessness and hunger are visible when I step out my front door. There is no money to fund additional projects.

Response to I-8-1

Thank you for your comment. Costs are an important consideration for the District. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

I-9: Hawkins

Comment I-9-1

Please stop the sprawl. Stop all development of farm land and opens spaces. If people choose to live in a flood plain so they can have a single family home then they should accept the risk.

Response to I-9-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat. Land use planning is the responsibility of the cities and unincorporated King County and not the District.

I-10: Oberlatz

Comment I-10-1

The Green River is one of the more productive Salmon streams in Puget Sound enjoying strong runs of natural and hatchery Chinook and Coho along with Chum and Pinks. Option 3 with a focus on flood plain restoration rather than channelization would only improve Salmon productivity in the Green River basin. This would also help mitigate potential negative impacts from global warming. Finally, the additional open space will also support increased populations of migratory waterfowl that migrate through western Washington.

Response to I-10-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat. Of the three alternatives, Alternative 3 could provide the most improvement to fish habitat. This is explained in Chapter 4 of the PEIS and in detail in Appendix B. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

I-11: Marshall

Comment I-11-1

The project interactive map does nothing. When you put in an address all it does is show that address on the map. Nothing is shown as to what is being proposed, any future flood risks etc. Need more user friendly mapping. We've been thru this for years when the levee was built behind us. Communication needs to be clearer and more available.

Response to I-11-1

Thank you for your comment. The interactive map was intended to generally show what is currently at risk of flooding at a planning level. The District will consider your feedback for future communications.

I-12: Winters

Comment I-12-1

First please remove environmental justice and equity and fairness please do not use the risk of flooding as a political platform that doesn't belong here. Do the right thing and provide stuff that protects the homes and businesses along the river if that means more levees or higher levees or rerouting some of it then I would recommend doing that but please do not bring political crap into this where it does not belong

Response to I-12-1

Thank you for your comment. The District is proposing an integrated approach to floodplain management that includes protection for homes and businesses. The District has adopted policies that include considering "Equity and Social Justice" and "Environmental Justice" as part of flood management. These policies are explained in Chapter 5 of the PEIS.

I-13: Shocki

Comment I-13-1

We need a plan that will address the concerns raised in the latest IPCC report which projects that we will hit 1.5 C warming by the 2030s (less than 10 years away). A lot of kids live in the Signature Pointe and other riverside developments and we need to ensure they are safe from flooding *without* displacing them to higher rents. These are some of the last affordable developments in commuting distance of Seattle and are close to schools.

Response to I-13-1

Thank you for your comment. The District has made climate change an important part of its work. As described in the PEIS Appendix B Section 2, the District had the University of Washington Climate Impacts Group study the potential effects of climate change on the Lower Green River. Also, protecting disadvantaged communities is a priority for the District and is one of the multibenefits. Under Alternatives 2 or 3, adaptive management would periodically reconsider the effects of climate change and respond as appropriate. Under all alternatives, Signature Point would continue to be protected.

I-14: Storkson

Comment I-14-1

To whom it may concern, I received the flyer in the mail today, and I really think that someone should have field tested the flyer more before it was sent out to the public. The map on the back is a total waste. One really doesn't know where the boundaries are for improvement, and the map is totally useless. In fact the quality is so poor, I consider the attempt to inform the public of the proposed project through the information on this flyer to be a complete waste of tax payers dollars. If you can't send out a piece of literature that allows a person to see how they fit into the picture, then don't bother to send anything!

Response to I-14-1

Thank you for your comment. The District will consider your feedback for future communications.

I-15: Taylor

Comment I-15-1

Our address is 8533 South 259 St, Kent 98030. There are three alternatives to consider & an option of “do no building“ Along Green River, because of possibly/likely flooding. I would like an explanation of how it would affect our specific condominium community, Riverfront Park. Arrange a presentation or speech to homeowners? We’ve lived here over 20 years. It’s our home. I at least would like to better understand the e mail & choices offered, & costs involved …etc Thank you Morgan Taylor

Response to I-15-1

Thank you for your comment. There is an existing PL 84-99 levee between the address provided and the river. As described in PEIS Chapter 3 and Appendix A, under all three alternatives, the existing levee would be improved to provide protection during an 18,800 cfs flood event. Following the publication of the final PEIS, the District Board of Supervisors will determine the next steps through a legislative process, incorporating information from the PEIS, including comments and findings. During this process, the Board will take input from the public.

I-16: Motta

Comment I-16-1

Dear Sirs, I received your Flood Risk Mask. Unfortunately, I can’t make hide-nor-hair of it. I just want to know if I’m going to lose my home to flood, earthquake or volcano eruption!! And where I need to go.

Response to I-16-1

Thank you for your comment. The District will consider your feedback for future communications.

I-17: Luck

Comment I-17-1

I strongly urge you to take robust precautions to prevent and deal with flooding in the Lower Green River Corridor. We win in the end by spending time, money and effort to avoid disastrous floods. Thank you for taking action.

Response to I-17-1

Thank you for your comment. All three of the alternatives under consideration by the District would substantially reduce flooding in the Lower Green River Corridor.

I-18: Jones (public meeting transcription)

Comment I-18-1

MS. JONES (providing comment): I just -- I just -- I just wrote in the -- in the Chat. Does King County get any funding from FEMA, or does FEMA only jump in when there's a disaster?

MS. FAUCETT (staff): Michelle's just taking a moment. \

MS. CLARK (District Executive Director): So, hi, Kathi. FEMA jumps in when there is a federally declared disaster.

MS. JONES: Um-hmm. Um-hmm.

MS. CLARK: And even then, we -- we -- the Flood District doesn't really get involved, but King County has to apply for aid, and they collate and collect a whole bunch of information, and they apply for aid and see if FEMA comes in. But FEMA really is after the waters come. We are -- the Flood District is before the waters come in a hope to avoid bringing FEMA in.

MS. JONES: Okay. Hmm.

MS. FAUCETT: Great. Thank you, Michelle. Kathi, any other questions?

Response to I-18-1

Thank you for your question. The role of FEMA before, during, and after a disaster is described in PEIS Appendix A, Section 2.2..1.2. FEMA administers the National Flood Insurance Program, which provides a financial mechanism to respond to flood disasters by making flood insurance available to private property owners.

Comment I-18-2

MS. JONES (providing comment): No, not at this time. You know, I can recall, before we had the 3,000-pound sandbags, a group of us did go to King County and sat in a conference, and I think one of the proposals was to remove all of the industrial, all of the everything so that you wouldn't have a flood. And, of course, the other important thing here is, as was said, if there were flooding, we are the second largest warehouse distribution on the West Coast, and that certainly would impact financially to so many individuals. So, you know, obviously, our community is -- is -- is very important, and we -- we had a considerable amount of land taken from my community under eminent domain, but, you know, we assumed that this -- the levee is going to work. I think it will be very interesting because of that Russell Road project, which I believe is supposed to open this summer, which will include recreation. You know, that -- that should really be something that to be -- you know, wonderful for this area, and I think it's going to also be something that is creating a better flood protection.

Response to I-18-2

The District is proposing an integrated approach to floodplain management that is intended to protect people, property, and jobs, while supporting agricultural land use, economic development, equity and social justice, habitat restoration, housing, recreation, salmon recovery, water quality, and other issues. This integrated approach is intended to reduce flood risks while sustaining the economic prosperity of the region and improving fish habitat.

Comment I-18-3

MS. JONES (providing comment): So I -- I will email or -- email people in my community, and possibly even have maybe a little more of a focus group to see if -- what people's concerns might be, and just educate them a little bit more. So I think it will be important to be able to have access to this for the people in my community. Um-hmm.

MS. FAUCETT (staff): Fantastic. Thank you, Kathi.

MS. JONES: Um-hmm.

MS. FAUCETT: And -- and I think you have my contact number or information, and I know you have Michelle's as well. If you need anything to help, if there's something beyond what's either on the website, there's fact sheets and this presentation, just reach out, let us know.

MS. JONES: Okay. Will do. Thank you.

MS. FAUCETT: Yeah. And I believe you maybe haven't seen it, but I think we sent you what we are calling our social media tool kit, which just has some kind of condensed info if you want to send to a Listserv –

MS. JONES: Yep -- MS. FAUCETT: -- within your community –

MS. JONES: -- I saw that.

MS. FAUCETT: Yeah, great. Great. So just let us know if you need something else.

MS. JONES: Um-hmm. Good.

MS. FAUCETT: Good. And we appreciate you helping to get the word out.

Response to I-18-3

Thank you for coordinating with your community.

Comment I-18-4

MS. CLARK (District Executive Director): And you had mentioned eminent domain at our last meeting, Kathi, when we talked scoping, and I -- and I tried to do a little bit of research about that, so -- and I think that that was dealings that your community had with the City and/or the County, but it wasn't Flood District related, even though it was flooding related.

MS. JONES (providing comment): No. What it had to do was, where the levee was going to be built, we had -- you know, we had considerable land in our community that the levee was moved within ten feet of the decks of the condos. Okay? So all of that and -- and in all reality, the people who owned those condominiums, they missed the trees, okay? New people who have bought them, they never even knew it was there, and we have a bike trail along there, so, you know, it was really a nonissue.

Response to I-18-4

Thank you for providing this perspective on past projects along the Lower Green River. Please refer to the response to comment I-18-2.

Comment I-18-5

MS. JONES (providing comment): But also, along that -- you know, that bike trail, down through Auburn, it's really fascinating to see the amount of work, the salmon restoration areas and stuff, so, you know, there's been incredible work, and -- but I think it's so important to educate people about what has been done, and even from an environmental standpoint, and – and making the Green River as a resource area, you know, to a community, to have this Green River trail and access to the river as being so important. So important.

Response to I-18-5

Thank you for your comment. Please refer to the response to comment I-18-2.

N-1: Anonymous

Comment N-1-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Housing, schools, and community spaces

2. How are these assets used by community members? Very important

Response to N-1-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, schools, and community spaces. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-1-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? All of the above

Response to N-1-2

Thank you for your comment. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

N-2: Anonymous

Comment N-2-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Most roads are blocked off when it floods which causes detours which extends travel time.

2. How are these assets used by community members? Most people use roads in their daily life which can be a hassel if you need to be somewhere at a certain time."

Response to N-2-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-2-2

4. Anything else you'd like to comment on regarding flooding in your community? Find an option that does not effect nature.

Response to N-2-3

Thank you for your comment. Appendix B of the PEIS includes information on how each alternative could affect the natural environment.

N-3: Anonymous

Comment N-3-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Schools, roads

2. How are these assets used by community members? Driving to school

Response to N-3-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-3-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why?

They are important to me because I think it is important to get to places.

Response to N-3-2

Thank you for your comment regarding the importance of being able to get around. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

N-4: Anonymous

Comment N-4-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Drive in high water over roadway Kent, WA, Auburn, WA

2. How are these assets used by community members? Driving and getting to bus stop

Response to N-4-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-4-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? I travel daily for work.

Response to N-4-2

Thank you for your comment regarding the importance of being able to get to work. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

N-5: Anonymous

Comment N-5-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? This will destroy roads, schools, and other locations.

2. How are these assets used by community members? This gives access to work and other important places.

Response to N-5-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-5-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? This will allow us to move around safely on the way to work, shopping, and other activities.

Response to N-5-2

Thank you for your comment regarding the importance of being able to get around. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-5-3

4. Anything else you'd like to comment on regarding flooding in your community? It is really important that will help a lot to access other places.

Response to N-5-3

Thank you for your comments regarding the importance of being able to move through the area. Please refer to the responses to comments N-5-1 and N-5-2.

N-6: Anonymous

Comment N-6-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Streets, schools and parks

2. How are these assets used by community members? To get to work, to school, to the park. Recreation.

Response to N-6-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools, jobs, parks, and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-6-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? I think for me, all the benefits are very important, streets, parks, schools, everything.

Response to N-6-2

Thank you for your comment regarding the importance of all the multibenefits. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-6-3

4. Anything else you'd like to comment on regarding your flooding in your community? Hopefully everything will be carried out for the benefit of the whole community and the environment. Thank you

Response to N-6-3

Thank you for your comment. Please refer to the responses to comments N-6-1 and N-6-2.

N-7: Anonymous

Comment N-7-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Transportation

2. How are these assets used by community members? To get from work

Response to N-7-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-7-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Transportation is important to me because my wife doesn't know English and when she had appointment somewhere.

Response to N-7-2

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Shopping stores, trails, parks, lanes

2. How are these assets used by community members? Attending events, fitness, shopping

Response to N-200-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as parks, trails, and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-200-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Protect fish resources and animal habitats. Global climate change has become unpredictable. Abnormal climates and even disasters, the single and fragile ecological structure may be completely destroyed if it encounters extraordinary weather changes. We shall focus on long-term flood control, systemic flood control, and comprehensively broaden the bearing capacity of ecological level. The short-term economic loss will be [text cut off] in the long-term. The advantages outweigh the disadvantages when disasters may occur.

Response to N-200-2

Thank you for your comment regarding the importance of protecting fish resources and animal habitats. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-200-3

4. Anything else you'd like to comment on regarding your flooding in your community? With regard to the personnel with a relatively high amount of money, the acquisition and relocation of industrial area, more detailed regional planning is required, and it should be gradually realized. The protection of agriculture should also be at the core of focus. It may be necessary to relocate residents first and re-plan and adjust industrial areas and it should also consider avoiding secondary relocation, as well as the design should be in place. In addition to the acquisition, is there any other balanced economic plan, such as the future use rights of some seasonal areas, or new concept [text cut off] to enable flood areas to retain some functionality in case of flooding, this may require some entirely new techniques [text cut off] and architectural advances. Whether it also properly provides new jobs during the reconstruction process to make up for part of the economic losses caused by the disappearance or relocation of industrial areas. There is a huge gap between the amount of money affected by plan 3 and plan Is there any compromise plan?

Response to N-200-3

Thank you for your suggestions. Following the publication of the final PEIS and a review of the comments received, the District Board of Supervisors will decide what to do. Comment N-201-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Near North Seattle College, close to north lake, Magnuson park, Carkeep park

2. How are these assets used by community members? I work at North Seattle College. A friend of mine lives in Woodlawn A [text cut off] N, near North Seattle . The Cr [text cut off] was overflooded near her sister's apartment last winter, up to to her waist and all the furniture in her home was submerged. Seattle City [text cut off] another apartment nearby for my friends after their house flooded for two months, and some of their losses could also be declared. Magnuson park is that I often go to, near Lake Washington. Carkeek park, close to the church I attend, is a place where children often go to activities.

Response to N-201-1

Thank you for your comment. The PEIS is focused on the Lower Green River Corridor that includes portions of the cities of Renton, Tukwila, Kent, and Auburn, as well as unincorporated King County.

Comment N-201-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? The best flood control measures should be aimed at reducing hazards to human life, while protecting the natural habitats of other organisms is also important. Because if a certain place is not safe, people may move away or stop activities nearby, but fish and wild animals may not move freely so easily.

Response to N-201-2

Thank you for your comment on the importance of reducing hazards and protecting natural habitat. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-201-3

4. Anything else you'd like to comment on regarding your flooding in your community? In my opinion, when the house owner sells or rents, the buyer or the tenant must be informed that the house is at risk of flooding (in flood zone) [text cut off] In public communities such as churches,
schools, congregants and students should also know whether there is a risk of flooding in places they frequent visit.

Response to N-201-3

Thank you for your suggestions. Following the publication of the final PEIS and a review of the comments received, the District Board of Supervisors will decide what to do. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged with this process and learn more about flood risk reduction in King County.

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Benefit park, walking paths, family gatherings, enjoy weather

Response to N-227-2

Thank you for your comment regarding the importance of parks, walking paths, and places for family gatherings. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

N-228: Anonymous

Comment N-228-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Kent, WA

2. How are these assets used by community members? To get to and from work, school, activities

Response to N-228-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools, jobs, and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-228-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Parks, walking paths, and trail, picnic place

Response to N-228-2

Thank you for your comment regarding the importance of parks, walking paths, and trails. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

N-229: Anonymous

Comment N-229-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? School, parks

2. How are these assets used by community members? Recreation

Response to N-229-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools, parks, and recreation facilities. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-229-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Habitat

Response to N-229-2

Thank you for your comment regarding the importance of protecting habitats. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-229-3

4. Anything else you'd like to comment on regarding flooding in your community? Government funding for the floodway

Response to N-229-3

Thank you for your comment. Property taxes are the primary source of funding for District projects.

N-230: Anonymous

Comment N-230-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Includes schools, nurseries, parks, residences, churches, roads and/or health care or service providers. 99 Ranch Market, IKEA, Feast Buffet, Seattle Tacoma Airport

2. How are these assets used by community members? 99 Ranch Market: Shopping IKEA: Shopping Feast Buffet: Serving Food Seattle Tacoma Airport: Airport

Response to N-230-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, schools, churches, healthcare facilities, and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-230-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? I think it is more important to protect fish or other animal habitats. Protecting habitats can ensure the diversity and reproduction of species, and prevent species from becoming extinct or endangered. Habitat destruction can negatively impact biodiversity by causing species to lose places to roost and forage.

Response to N-230-2

Thank you for your comment regarding the importance of protecting habitats. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-230-3

4. Anything else you'd like to comment on regarding your flooding in your community? River and river bank management: Strengthen the management of rivers and river banks, including regular riverway cleaning, river bank reinforcement, building dams and drainage systems, etc. Ensure the normal flow and drainage capacity of rivers and reduce the risk of flooding. Flood control levees and gates: Construction and maintenance of flood control dams and gate systems to control the flow of flood waters and distribute water flow. These structures can help reduce the impact of flooding on communities and protect critical facilities and infrastructure.

Response to N-230-3

Thank you for your suggestions. Following the publication of the final PEIS and review of the comments received, the District Board of Supervisors will decide what to do. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged with this process and learn more about flood risk reduction in King County.

N-231: Anonymous

Comment N-231-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Temple

2. How are these assets used by community members? Prayer (social)

Response to N-231-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as churches and temples. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-231-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Parks, mostly because it is really important for kids and seniors

Response to N-231-2

Thank you for your comment regarding the importance of parks. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-231-3

4. Anything else you'd like to comment on regarding flooding in your community? Flooding insurance

Response to N-231-3

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? All Is beneficial

2. How are these assets used by community members? All is beneficial and benefits my family

Response to N-642-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, schools, churches, jobs, parks, roads, and farms. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

N-643: Anonymous

Comment N-643-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? According to my neighbor's grandfather, there seems to be a lot of flood hazards in the lower reaches of the Green River, although not many in recent years. I've lived here in Kent for several years and it hasn't happened to me. If there is a real danger, I worry that homes, roads, schools will be flooded.

2. How are these assets used by community members? Live, work, shop and eat at restaurants by using the road

Response to N-643-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, schools, commercial areas, and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-643-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? The climate has changed a lot in recent years. I think fish and bird habitats should be greatly affected. If there are funds, please give priority to protecting them!

Response to N-643-2

Thank you for your comment regarding the importance of protecting fish and bird habitats. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-643-3

4. Anything else you'd like to comment on regarding your flooding in your community? I have read three plans, and I have doubts about the second and third ones. It mentioned above that it will affect neighboring properties. As a resident, I would like to know if it means household relocation? So where is the approximate area, how can we know? In addition, if relocation is required, we hope that there will be a satisfactory compensation policy

Response to N-643-3

Thank you for expressing your preference for Alternative 1 based on less property acquisition compared to the other alternatives. Appendix A Section 2.1.2 describes King County Flood Control District policies relating to property acquisition. The District's policy is to provide relocation assistance to tenants affected by property acquisition under the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970. Following the publication of the final PEIS and review of the comments received, the District Board of Supervisors will decide what to do. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged with this process and learn more about flood risk reduction in King County.

N-644: Anonymous

Comment N-644-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Residence, road

2. How are these assets used by community members? Commuting

Response to N-644-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-644-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Renovate the park

Response to N-644-2

Thank you for your comment regarding the importance of parks. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-644-3

4. Anything else you'd like to comment on regarding your flooding in your community? Increase drainage facilities

Response to N-644-3

Thank you for your comment.

N-645: Anonymous

Comment N-645-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? House, schools, medical facilities

2. How are these assets used by community members? For living schooling and healthcare

Response to N-645-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, schools, and healthcare facilities. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-645-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Environmental protection as global has affected the climate here

Response to N-645-2

Thank you for your comment regarding the importance of environmental protection. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

N-646: Anonymous

Comment N-646-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Schools and nurseries in the Kent

2. How are these assets used by community members? My two children are in kindergarten and primary school

Response to N-646-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools and nurseries. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-646-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Protect fish and animal habitats. Children usually go to the park near the river to play after school and on weekends. In autumn, they go to the Renton library to watch salmon migration. If it can be well protected, children can have more contact with nature.

Response to N-646-2

Thank you for your comment regarding the importance of protecting fish and animal habitats, as well as parks. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-646-3

4. Anything else you'd like to comment on regarding your flooding in your community? I think plan 1 or 2 is fine, try not to change the current layout, and it will not affect the current life.

Response to N-646-3

Thank you for expressing your preference for Alternative 1 or Alternative 2. Following the publication of the final PEIS and review of the comments received, the District Board of Supervisors will decide what to do. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged with this process and learn more about flood risk reduction in King County.

N-647: Anonymous

Comment N-647-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Cycling trails, trails

2. How are these assets used by community members? Cycling and hiking with friends and family on the weekend

Response to N-647-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as parks and trails. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-647-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? The weather in Seattle has become abnormal in the past two years. It is either very cold. For example, it is June now, and we still have to wear a sweater. In July and August, the temperature sometimes exceeds 100 degrees. This is not the case before, so I hope to be able to help transform and protect fish and other plant and animal habitats, thank you!

Response to N-647-2

Thank you for your comment regarding the importance of protecting fish, plant, and animal habitats. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-647-3

4. Anything else you'd like to comment on regarding your flooding in your community? Develop bicycle trails and trails along the river, and set up flood control knowledge points on the road for people who ride or hike to understand and spread!

Response to N-647-3

Thank you for your suggestion. The District will consider it moving forward. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged with this process and learn more about flood risk management in King County.

N-648: Anonymous

Comment N-648-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Road

2. How are these assets used by community members? The necessary route to and from school

Response to N-648-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-648-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Improve sidewalks and set drainage days

Response to N-648-2

Thank you for your comment regarding the importance of sidewalks and drainage. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-648-3

4. Anything else you'd like to comment on regarding your flooding in your community? Add sidewalks and add drainage days to help with floodwaters

Response to N-648-3

Thank you for your comment.

N-649: Anonymous

Comment N-649-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? My house, and facilities in the community

2. How are these assets used by community members? Residence, various family activities and community services

Response to N-649-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-649-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? It is hoped that the greening and activity facilities of the community park will be improved and upgraded

Response to N-649-2

Thank you for your comment regarding the importance of parks. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-649-3

4. Anything else you'd like to comment on regarding your flooding in your community? I carefully read the project file given to me by the navigator, and felt that the information on the three alternatives was rather vague, and I didn't understand the specific plan, budget, goal, and scope. Of course, I think the second plan is more ideal, as it can effectively improve flood control measures and will not relocate too many residents and businesses.

Response to N-649-3

Thank you for expressing your preference for Alternative 2. Following the publication of the final PEIS and review of the comments received, the District Board of Supervisors will decide what to do. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged with this process and learn more about flood risk reduction in King County.

Comment N-650-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Residence

2. How are these assets used by community members? Shopping, living.

Response to N-650-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing and commercial areas. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-650-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Stay on track

Response to N-650-2

Thank you for your comment.

Comment N-650-3

4. Anything else you'd like to comment on regarding your flooding in your community? None.

Response to N-650-3

Thank you for your comment.

N-651: Anonymous

Comment N-651-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? My family is in Auburn. I usually work in Kent and buy food and eat in South 99 Ranch Market. I am more concerned about these places.

2. How are these assets used by community members? Living, working, and doing activities are basically in the Valley

Response to N-651-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, jobs, and commercial areas. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-651-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Improve the highway facilities. The No.167, 181, and 5 highways on our side are very congested to and from get off work.

Response to N-651-2

Thank you for your comment regarding the importance of the highway facilities. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-651-3

4. Anything else you'd like to comment on regarding your flooding in your community? Highway safety must be guaranteed

Response to N-651-3

Thank you for your comment.

N-652: Anonymous

Comment N-652-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? The riverside area at the junction of Tukwila and Renton seems to be a neglected area, and the residents in this area don't seem to have any awareness of flooding.

2. How are these assets used by community members? I live and use various services in this area, and all facilities here are complete, including restaurants. The service industry is also well developed

Response to N-652-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as housing, schools, churches, jobs, parks, roads, and farms. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C. Thank you also for raising your concern about flooding awareness. The District will consider it moving forward. For additional information on flood preparedness, we encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org.

Comment N-652-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? I hope there will be more bicycle lanes, especially the scenery along the river bank, which is suitable for a family to ride together on weekends

Response to N-652-2

Thank you for your comment regarding the importance of places to bicycle. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-652-3

4. Anything else you'd like to comment on regarding your flooding in your community? It is very important to increase residents' awareness of flood disasters. In addition, we shall call on everyone to purchase flood insurance to protect their assets! Thank you for your work!

Response to N-652-3

Thank you for your suggestions. The District will consider them moving forward. We encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org to stay engaged in the process and learn more about flood risk management.

N-653: Anonymous

Comment N-653-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? I care about the walking trails and biking paths in the area because I would like to take my family there hiking or biking on weekends

2. How are these assets used by community members? I do exercise and have family/friend gathering there. We also enjoy restaurants there

Response to N-653-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as parks, trails, and commercial areas. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-653-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? We would like to see better parks for our gatherings

Response to N-653-2

Thank you for your comment regarding the importance of parks. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-653-3

4. Anything else you'd like to comment on regarding flooding in your community? It is good to know all the three alternatives would substancially reduce flooding in the areas. I wonder if you can use numbers and charts to compare the three alternatives to give us direct idea of their costs and benefits.

Response to N-653-3

Thank you for your comment. The PEIS Summary provides information that compares costs, impacts, and benefits of the alternatives being considered.

N-654: Anonymous

Comment N-654-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Parks, schools

2. How are these assets used by community members? Kids spending time in park, espacially during summer vacation and school are the musts that needs to be protected from natural and un-natural disaster

Response to N-654-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools and parks. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-654-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Social activity in kids in becoming less during these days. Parks play a big role.

Response to N-654-2

Thank you for your comment regarding the importance of parks. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-654-3

4. Anything else you'd like to comment on regarding flooding in your community? Education in community for natural disasters is must. More educated people less casualties during disasters.

Response to N-654-3

Thank you for your suggestion. The District will consider it moving forward. For additional information regarding flood preparedness, we encourage you to visit the King County Flood Control District website at: https://kingcountyfloodcontrol.org.

N-655: Anonymous

Comment N-655-1

1. What are the types of community assets that people use or rely on that might be impacted or damaged by flooding? Schools, parks, roads

2. How are these assets used by community members? Participate in events, shopping library provides free reading and children's story service

Response to N-655-1

Thank you for your comment. The PEIS Chapter 1 provides information on assets such as schools, parks, and roads. Chapter 4 of the PEIS explains how these assets could be impacted by flooding and flood hazard management. More detail on these subjects is available in Appendix C.

Comment N-655-2

3. Providing flood protection can also provide additional benefits to your communities beyond reducing flooding. Which are most important to you and why? Renovating community parks, sidewalks and other infrastructure is very important, especially the problem of water accumulation on roads in low-lying areas needs to be thoroughly investigated and repaired before the rainy season comes. In addition to flood control and disaster reduction and protection of animal habitats, vegetation protection in forests is also particularly important for ecological balance.

Response to N-655-2

Thank you for your comment regarding the importance of parks, sidewalks, drainage, and habitat protection. The King County Flood Control District is committed to achieving flood protection with additional benefits. Chapter 5 of the PEIS describes how this could happen for each alternative.

Comment N-655-3

4. Anything else you'd like to comment on regarding your flooding in your community? Hope to increase investment to protect residents' living, production and community environment.

Response to N-655-3

Thank you for your comment.

N-656: Anonymous

Comment N-656-1
